
The PACCAR Feedback Standard

Design specification for a CDK Drive
dealer-feedback plug-in

DOCUMENT

EgD-HAW-CDK-PLUG-001 · revision 1

CLIENT CONTEXT

Peterbilt Atlantic — eight locations, five provinces — eight CDK accounts on invoice 10002236

PREPARED BY

EVEglyph Design

STATUS

Design specification. Reverse-specified from public incumbent documentation. Not a PACCAR-endorsed document.

Key ID EgD-KEY-2026-07 · 2026-08-08T20:18:01Z

Pour le bien-être du peuple.

1. Why this document exists

The prior CDK research lane established what CDK Drive holds and how to get it out. It did not establish what a PACCAR dealer's management system is *expected to send back to the manufacturer* — and that is the thing that determines whether a dealer's system is considered whole by the OEM.

There is no published PACCAR interface specification. There is, however, a functioning de-facto standard, and it is legible: two vendors — **Karmak Fusion** and **Procede Excede** — hold the majority of Kenworth and Peterbilt rooftops between them, and both publish enough about their PACCAR integrations that the required surface can be reconstructed from their marketing, their release notes, their versioned product posts, and PACCAR's own Decisiv-hosted dealer support portal.

This document reconstructs that surface, names the gap between it and what CDK publishes, and turns the gap into a build specification.

Framing note. Everything below is derived from public sources. Nothing here asserts a data-rights position, an ownership thesis, or a migration intent. It is an integration-parity specification and should be handed to any third party in exactly that form.

2. The incumbent field

VENDOR	PRODUCT	PACCAR POSTURE IN PUBLIC MATERIALS	NAMED PACCAR INTERFACES PUBLISHED
Karmak, Inc. (Carlinville, IL; 100% employee-owned ESOP)	Fusion (on-prem Windows), Blaze (acquired with DSI Solutions, effective 2025-09-30)	Publishes a dedicated PACCAR integration page as a sales instrument; openly references a PACCAR "OEM integration scorecard"	13
Procede Software (Solana Beach, CA)	Excede (SQL Server, on-prem + browser)	Publishes versioned point-products (v1.1 / v1.2 / v1.3) via product-update posts; open, Swagger-documented Excede API and a Certified Partner Program	3 named + 3 corroborated
CDK Global (Brookfield-owned)	CDK Drive Heavy Truck	Markets "80+ Heavy Truck OEM-specific integrations" as a headline with no itemised public list	4

Karmak states its own scope plainly: "*Karmak's PACCAR OEM integrations support critical parts, service, inventory, financial, and warranty workflows through seamless data exchange between PACCAR systems and Fusion.*" (**Karmak — PACCAR integration**)

Note the five words in that sentence: **parts, service, inventory, financial, warranty**. That is the shape of the standard. CDK's public record covers parts and warranty. It does not cover inventory replenishment or financial reporting at all.

3. The register — what a PACCAR dealer system is expected to exchange

Fourteen interfaces. Direction is stated from the dealer's point of view. ↑ = dealer to PACCAR (the feedback leg). ↓ = PACCAR to dealer. ↔ = both.

#	PACCAR SYSTEM	DIR	BUSINESS OBJECT	MECHANISM (WHERE PUBLISHED)	KARMAK	PROCEDE	CDK
1	MDI — Managed Dealer Inventory	↕	Parts sales + demand/inventory position up; calculated Stock / MKT / COF replenishment orders down	Daily electronic file. Karmak's own release notes name a VMI daily inventory file built by CreateSendPaccarMDIDailyInventoryFile in class MgrPaccarMDI, and a returned COF file	Yes — all order types	Yes — testimonial	No
2	OPC — Online Parts Counter	↕	Fleet/major-account parts orders at dealer pricing; availability and supersession lookups	Procede: "a Windows application, web service, and Excede API"; CDK: "required by PACCAR and available on Fortellis"	Yes	Yes v1.1/1.2	Yes
3	PRWS — Registration & Warranty System	↕	Warranty claim drafted from the repair order; SIR sheets, campaigns and recalls returned	Claim draft from RO, real-time response, resubmission; on Fortellis for CDK	Yes	Yes v1.2	Yes
4	Financial Reporting	↑	Dealer month-end financial statements uploaded to PACCAR	Karmak generates the statement in-system (GLM96520 OEM Financial — PACCAR) and transfers to the PACCAR site	Yes	No	No
5	FOCUS — PACCAR Parts CRM	↑	Customer and parts sales data for purchasing-pattern analysis	Automated send	Yes	No	No
6	Service Gate — PACCAR Parts Fleet Services	↕	Pre-authorisation on estimates, authorisation on completed work, final invoices + PDF copies up, remittance down	Secure electronic transmission	Yes	Yes — testimonial	No
7	Decisiv — PACCAR Solutions / TruckTech+ / SmartLINQ	↕	Service case ≠ repair order: estimate in, parts pricing/availability query, line-level corrections, invoice number/ date, auto-close on invoicing	System-to-system case integration. PACCAR's own support portal publishes a per-vendor feature list	Yes — deep	Yes — deep	Thin — 1 para
8	Electronic Parts Invoices	↓	PACCAR Parts invoices matched to PO and receipt, posted to AP	ANSI X12 EDI 810 inbound invoice — the only wire-format either vendor names	Yes	Yes	Partial — "coming soon"
9	ePacking Slip / ASN	↓	Advance ship notice; receive against split or multi-order shipments	Electronic packing slip	Yes	Partial	Partial
10	Parts Orders (Stock / Emergency)	↑	Dealer-generated purchase orders outside the MDI-managed flow	Export/upload	Yes	Yes	No

#	PACCAR SYSTEM	DIR	BUSINESS OBJECT	MECHANISM (WHERE PUBLISHED)	KARMAK	PROCEDE	CDK
11	Truck Order Data — "PACCAR's B2B infrastructure"	↓	Chassis build data and specifications mapped into vehicle master at delivery	Retrieval from B2B infrastructure; no named platform	Yes	No	No
12	PacLease RPS — Rental Performance System	↓	Rental customers, units and contracts created/updated in the DMS	Event-driven	Yes	No	No
13	Customer Loyalty Card	↕	Loyalty eligibility, coupon application and redemption at counter and through OPC	Price file / query form; Procede tracks redemption in a temp table with an Expired column	Yes	Yes v1.3	No
14	eInvoicing to PACCAR (D/C memo automation)	↑	Debit/credit memos created and balanced against posted POs	EDI 810 + Excede API	Partial	Yes v1.2	No

Source basis: [Karmak's PACCAR integration page](#), [Karmak Fusion 3.59 cumulative release notes](#), [Procede's integrations catalogue](#), [Procede's PRWS v1.2 product update](#), [PACCAR Parts' technology page](#), [PACCAR Solutions' feature list for Karmak Fusion](#), [CDK's Heavy Truck OEM newsletter](#) and [Fortellis' heavy-truck launch post](#).

4. The feedback leg, isolated

Strip out everything PACCAR pushes down and what remains is the actual "feedback standard" — the seven flows that run **up** from the dealer's system to the manufacturer:

FLOW	CADENCE	GRAIN	FINANCIAL MATERIALITY
Parts sales + demand → MDI	Daily	Line, by rooftop	Sets replenishment; drives obsolescence and turn
Month-end statements → Financial Reporting	Monthly	NADA-style departmental P&L and balance sheet	Determines OEM standing, floor-plan and 20-Group position
Customer + parts sales → FOCUS	Continuous	Customer × SKU	Feeds OEM-side marketing back at the dealer's own customers
Warranty claims → PRWS	Per RO	Claim, coded	Direct receivable
Final invoices → Service Gate	Per invoice	Invoice + PDF	Direct receivable, national accounts
RO line corrections, invoice, close → Decisiv	Real time	RO line	Case truth for fleet customers
Stock/Emergency POs → Parts Orders	As raised	PO	Working capital

The observation that matters for the build. Six of these seven are transactional and already have a defined counterpart. The odd one out is **Financial Reporting** — it is periodic, it is the only flow carrying the dealership's whole financial position rather than a transaction, it is the one Karmak singles out on its own page, and it is the one CDK has never mentioned in public. It is also the one that maps directly onto work already built in this repository: the ledger model, the accounting-schedule objects, and the June 2026 tie-out. If a plug-in is going to be built, that is where it starts.

5. What CDK actually publishes, and where the floor sits

Across every public CDK Heavy Truck property, the complete set of named PACCAR systems is four: **OPC**, **PRWS**, **electronic shippers** (marked "coming soon"), and **Decisiv**. The dedicated OEM integrations page carries a "Paccar" heading and then degrades to *"The PACCAR integration helps dealers keep key workflows connected across systems"* — naming nothing ([CDK Heavy Truck OEM & ISV integrations](#)).

The most specific CDK writing found anywhere is a 2022 Fortellis post that is four years old and framed prospectively: *"We're hoping to launch at least five integrations this summer with two major OEMs — PACCAR and DTNA"* ([Fortellis](#)).

Three honest readings of that silence, none of which the public record can settle:

1. CDK genuinely does not have MDI, Financial Reporting, FOCUS, Service Gate, RPS or Loyalty.
2. CDK has them and does not publish at Karmak's level of detail, because Karmak uses its integration page as a sales weapon and CDK does not.
3. The material exists behind CDK's dealer and partner login walls.

This is the single highest-value question to put to CDK, and it is a completely neutral one to ask. A dealer asking "which of these fourteen do we already have entitlement to?" is asking a support question, not making an argument.

6. The acceptance test already exists: the PACCAR scorecard

Karmak's own FAQ confirms the grading instrument: *"PACCAR scorecard performance reflects how well a business system aligns with OEM requirements, data standards, and operational workflows. Strong scorecard results help dealers avoid integration gaps, reduce operational friction, and stay aligned as PACCAR programs and expectations change."* ([Karmak](#))

PACCAR does not publish the scorecard's criteria. But its existence changes the design brief: the plug-in is not being built against a spec document, it is being built against an **evaluation** — and the register in §3 is the best available reconstruction of what that evaluation covers. Design to the register, and the scorecard follows.

Verification target. Ask PACCAR, through the dealer's own OEM contact, for the scorecard's dimensions and Peterbilt Atlantic's current result. This is a dealer's own performance record. It costs nothing to request and it converts a reconstruction into a specification.

7. The standards layer — what the plug-in can actually speak

LAYER	STANDARD	STATUS FOR THIS BUILD
Parts invoice	ANSI X12 EDI 810	Real and named by both incumbents. The only confirmed wire format in the whole register. Build to it.
Service vocabulary	VMRS (ATA Technology & Maintenance Council)	Live heavy-truck vocabulary. Karmak licensed it from TMC in March 2025 to standardise service intelligence shared with "dealers, fleets and OEMs." Adopt VMRS coding on the twin's labour and part lines.
Warranty coding	PACCAR's own claim schema	Campaign Code, Campaign Type, Claim Category, Repair Type, Customer Concern Code, Causal Code, Corrective Action Code, Responsibility Code, Failure Location, Causal Part, Supplier Code, SRT. Mandated by PACCAR, evidenced in its own technical bulletins. Not negotiable, and not a standard — a format.

LAYER	STANDARD	STATUS FOR THIS BUILD
Dealer↔OEM messaging	STAR — Standards for Technology in Automotive Retail	STAR6 XML v6.2.4 (2024) and the January 2026 Automotive Retail Domain Model, which finalised a Parts, AP, Accounting, Payroll and HR domain set. STAR names "Medium & Heavy-duty Trucks" as a covered segment, but no truck-specific BOD variants were found and no public evidence names PACCAR as a member. Use STAR as the vocabulary of the design, not as a claim of compliance.
Inventory replenishment	DIF / SOF pattern	Documented for DAF/Europe: dealer DMS generates a nightly Dealer Inventory File , PACCAR returns a Suggested Order File , dealer accepts or overrides. Consistent with — but terminologically distinct from — Karmak's North American VMI file and Stock/MKT/COF order types. Treat DIF/SOF as the pattern, VMI/COF as the North American names.
Financial statement	No public standard found	STAR has a Financial Statement BOD scoped to balance sheet and P&L, and NADA contributes standardised <i>ratio definitions</i> — but no universal cross-OEM dealer-statement transmission format exists. Karmak's "automatically download to PACCAR" therefore rests on a proprietary PACCAR mechanism , and that mechanism is the specification gap at the centre of this build.

8. Design specification — the CDK plug-in

8.1 Shape

A **sidecar**, not a modification. It reads CDK Drive through entitled dealer-authorised routes already established in this repository — the CDK Data Export Tool over SFTP/PGP, Dealer Data Exchange, and Fortellis where an API exists — lands in the dealer's own Azure Postgres, and emits PACCAR-shaped artefacts. It writes nothing back into CDK. It asks CDK for no new privilege beyond the dealer's existing entitlement.

8.2 Lanes, in build order

Lane F — Financial Reporting (first). Highest value, largest published gap, and the only lane whose input already exists in this repository. Generate the PACCAR month-end statement from the twin's own ledger extract, tie it to the June 2026 tie-out month, and reconcile it against whatever Peterbilt Atlantic files today. Deliverable: a statement the controller can compare line for line against the manual one. If it matches, the twin has proven it holds the dealership's financial truth.

Lane I — Inventory / MDI. Reconstruct the daily outbound demand-and-position file and the inbound order-recommendation handling, carrying the order-type distinction (Stock / MKT / COF) as a header field on the parts-order record. Note the twin does not need to *transmit* to prove value: it needs to show whether the recommendations the dealer accepts are the right ones. **The read-only version of this lane is a variance report, and a variance report requires no PACCAR permission at all.**

Lane W — Warranty / PRWS. Already partly reachable through Fortellis. Model the full claim schema as a first-class object so claim quality, rejection rates and days-to-payment become measurable.

Lane S — Service case / Decisiv. Mirror the case↔RO shape. CDK's published behaviour is one paragraph; Karmak's and PACCAR's own portal documentation is the better specification of what the integration is *supposed* to do, and is a fair benchmark to hold CDK's to.

Lane R — Receivables / Service Gate + eInvoicing. EDI 810 in, invoice and PDF out, remittance matched. Straight cash-cycle value, and the easiest lane to quantify.

Lane C — Customer / FOCUS + Loyalty. Lowest priority and the one to think hardest about, because this is the lane where the dealer's own customer and sales data flows outward to the manufacturer. Model it; do not rush to widen it.

8.3 Per-lane contract

Every lane ships with the same six artefacts, no exceptions:

1. **Object model** — the records and fields, source-native widths preserved, every widening logged.
2. **Provenance** — for each field, the CDK object it came from and the extraction route used.

3. **Confidence tag** — DOCUMENTED or INFERRED, carried through to the surface.
4. **Reconciliation** — a tie-out against the dealer's existing reported figure.
5. **Variance record** — disagreements held and shown, never averaged away.
6. **Access gate** — the named entitlement, credential and approval each lane depends on, stated before build.

8.4 What is explicitly out of scope

Raw telematics ingestion. Write-back to CDK. Any route that requires a per-data-type third-party access fee while a dealer-entitled export route exists. Anything that asks Peterbilt Atlantic staff to change how they work before the value is demonstrated.

9. Engagement question set

To be put to CDK — and, where noted, to PACCAR through the dealer's own channel. Every question is one a dealer is entitled to ask about its own systems. None of them reveals a design intent, a data-rights position, or a comparison being run. Ask them as an existing customer improving its own operation.

To CDK, on entitlement (neutral, answerable, high yield):

1. Which PACCAR integrations are included in Peterbilt Atlantic's current subscription across all eight billed accounts, and which are separately licensed?
2. Does CDK Drive Heavy Truck support PACCAR Managed Dealer Inventory — the daily inventory and demand file and the Stock / MKT / COF order types? If so, is it active on our rooftops?
3. Does CDK Drive generate the PACCAR month-end financial statement, and does it transmit it to PACCAR automatically or does our controller still upload it manually?
4. Does CDK support PACCAR Parts Fleet Services (Service Gate) invoice transmission and remittance retrieval, and the FOCUS customer/parts sales feed?
5. Which of the "80+ Heavy Truck OEM-specific integrations" are PACCAR-specific? Is there a current list we can be given for our own planning?
6. Is the PACCAR electronic shipper integration, described as "coming soon," now generally available?
7. Which PACCAR-related APIs are available to us on Fortellis today, and under which subscription?

To CDK, on mechanics (still neutral — these read as an integration-hygiene review):

1. For each active PACCAR interface: what is the transport, what is the schedule, and where do failures surface for our staff to see?
2. Where can our accounting team see a transmission log and a failure/retry history for OEM interfaces?
3. Which PACCAR interfaces run on EDI, which on file exchange, and which on API?
4. What is the documented behaviour when a PACCAR interface fails mid-month — is there a replay?

To PACCAR, through the dealer's own OEM contact:

1. What are the dimensions of the PACCAR OEM integration scorecard, and what is Peterbilt Atlantic's current standing?
2. Which PACCAR programs are we eligible for that our current DMS configuration does not enable?
3. Is there a PACCAR-published interface specification available to dealers, as distinct from one available only to DMS vendors?

Posture. Additive and curious throughout. Every answer improves the dealership's operation whether or not anything else is ever built, and that is a true statement — which is what makes the posture sustainable rather than a tactic. If CDK's answers are strong, the register in §3 becomes a validated inventory. If they are thin, the register becomes the gap analysis. Both outcomes are useful, and neither requires a card to be shown.

10. Open questions and verification targets

#	QUESTION	HOW TO CLOSE IT	COST
1	Does CDK Drive have MDI and Financial Reporting at all?	CDK question 2 and 3	Free
2	What are the PACCAR scorecard dimensions?	PACCAR question 12, through the dealer	Free
3	What is the PACCAR financial-statement file format?	Ask PACCAR; failing that, inspect what the controller uploads today	Free
4	Is the VMI daily file layout obtainable?	Karmak release notes name the routine but not the layout; ask PACCAR	Free
5	Are PRWS and OPC discoverable Fortellis catalogue entries or bundled into CDK's general Drive products?	Authenticated Fortellis directory check	Cheap
6	Post-acquisition, do Karmak Blaze rooftops carry the same 13 interfaces as Fusion?	Karmak publishes nothing yet	Cheap
7	Is PACCAR a STAR member?	No public evidence found	Cheap
8	Which of the eight CDK billed accounts carry which integration entitlements?	Requires the CDK Billing Center itemisation absent from the summary invoice	Free, but gated on access

11. Provenance

Reconstructed from public vendor and OEM documentation on 2026-08-08. Full source-cited working papers are held in this repository at `research/karmak_paccar.md`, `research/procede_paccar.md` and `research/cdk_and_standards.md`. Every claim in this specification is traceable to a quoted primary source in those files, and each is tagged there as DOCUMENTED or UNVERIFIED. Where a vendor's claim could not be confirmed against a primary source, it is not asserted here.

No confidential Peterbilt Atlantic, CDK, Karmak, Procede or PACCAR material was used in its preparation.
