

# CDK Drive, read as an ERP

**Nine rooftops, one tenant, and the parts of the ledger you cannot reach through an API.**

**What this is.** A synthesis of eight cited research lanes on CDK Drive as it would be operated by Peterbilt Atlantic — nine Peterbilt/PACCAR rooftops in Atlantic Canada — written against SAP FI/CO/MM as the reference frame. It is not a product evaluation and not a pitch. Where CDK's own documentation stops, this note says so and stops with it.

**Evidence grammar, applied literally.** [DOCUMENTED] a named CDK, Fortellis, OEM, regulator, court or standards-body source says it. [INFERRED] it is dealer-accounting or ERP norm, corroborated on an adjacent system, not confirmed on CDK. [UNVERIFIED] nobody public says it; the concept is named but the CDK artefact behind it is not. No CDK field name, table name, function code or endpoint appears in this note unless a cited source printed it. Where a term was wrong in the original brief — PartsPRO, ODDX, CDK Data Cloud — it is corrected or struck rather than carried forward.

The one-paragraph version, so the rest can be read in any order: CDK Drive is a single hosted tenant partitioned per rooftop, whose subledger architecture is a generalisation of SAP's reconciliation-account pattern to every balance-sheet account that carries open items. Its repair order behaves as an internal order with a settlement rule keyed by pay type. Its parts master is recognisably MARA/MARC/MARD/MBEW with a supersession chain and an escalated point-of-sale cost that is not the moving average. Its master data is store-scoped, which at nine rooftops multiplies the duplicate problem by nine. And its API surface is deep in service, thin in parts, vestigial in accounting and absent in payroll, vendor and general warranty — which means the ledger has to be reconstructed from a scheduled file export, not called for. Above the dealer, PACCAR runs SAP and owns the telematics record outright.

## 01 What CDK Drive is, and how nine rooftops are cut up

CDK Global is the former ADP Dealer Services business, spun out onto NASDAQ on 1 October 2014; the name is a contraction of Cobalt, Dealer Services and Kerridge — three acquisitions, three code bases [DOCUMENTED] ([CDK Global corporate history](#)). Brookfield Business Partners took it private in July 2022 at \$54.87 a share, \$6.4B equity and \$8.3B enterprise value [DOCUMENTED] ([Brookfield acquisition release](#), [Bloomberg on the \\$8.3B deal](#)). There are no post-2022 public financials. The last disclosed year, FY2021, was \$1,673.2M revenue of which \$1,313.9M — roughly 78% — was subscription [DOCUMENTED].

**Drive is not one product.** Drive is the flagship integrated system of record covering sales, F&I, service, parts, accounting and payroll [DOCUMENTED] ([CDK Drive product page](#)). Drive Flex, launched March 2018, is a ground-up rewrite on AWS with usage-based pricing aimed at one- and two-rooftop dealers — new code, new database architecture, and it requires every OEM interface to be re-programmed. It is not an upgrade path from Drive [DOCUMENTED] ([Automotive News on the Drive Flex launch](#), [Dealer Tech Nerd on the separate code base](#)). The current marketing family is the Dealership Xperience Platform, with Foundations carrying enterprise/multistore accounting and centralised management, and Fundamentals aimed at one to two sites [DOCUMENTED] ([CDK DMS suite page](#)). Separately, CDK runs a distinct Heavy Truck product line on its own site, claiming 80-plus heavy-truck OEM integrations [DOCUMENTED] ([CDK Global Heavy Truck DMS, Heavy Truck OEM and ISV integrations](#)). **Which of these Peterbilt Atlantic actually sits on is the first question to settle with Luke**, because the heavy-truck line's field-level schema is nowhere public [UNVERIFIED] and the light-vehicle API documentation cannot be assumed to describe it.

**The partition — four levels, and only two of them exist in the API**

| LEVEL                                          | WHAT IT IS                                                                                                                                                                              | EXPOSED AS                                                                                                   | YOUR ANALOGUE                                                                                                    |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Dealer / CMF / Client #</b><br>[DOCUMENTED] | Top-level CDK client identifier tied to the DealerSuite account; the contract and billing entity, and the anchor against which subscriptions are issued.                                | Not a header. Visible on the DMS support pane.                                                               | Above company code — there is no SAP object; it is the client itself.                                            |
| <b>Company Number ("Co ID")</b> [DOCUMENTED]   | Store-level accounting entity inside a Dealer/CMF. Third-party accounting integrations require a "Default Company ID (store number)" per store, one line per additional company.        | Legacy/EDI integration layer only. No Company-Number header exists in any Fortellis spec found. [UNVERIFIED] | BUKRS. One company code per rooftop is the only mapping consistent with the evidence.                            |
| <b>Subscription-Id</b><br>[DOCUMENTED]         | Fortellis-issued identifier binding one app to one dealer store. Issued at marketplace activation.                                                                                      | Subscription-Id header, required on every call.                                                              | No SAP analogue. It is an integration-control artefact and belongs in its own table, not in a master-data table. |
| <b>Department-Id</b><br>[DOCUMENTED]           | Identifies the DMS department targeted. Each Department-Id is bound to <b>exactly one DMS type</b> : Accounting, Finance, Inventory, Parts or Service. Response data is filtered by it. | Department - Id header, required, CDK-specific rather than Fortellis-wide.                                   | Closest to a mandatory account-assignment scope — module plus organisational unit — not a cost centre in itself. |

Sources for the four levels: [CDK Drive Get Customer v3 developer guide](#) for the header contract and the one-DMS-type-per-department rule; [Mitchell RepairCenter CDK setup guide](#) for the per-store Company ID; [Fortellis community thread on marketplace subscriptions](#) for "each store will have their own set of department-IDs"; [BettrData's Fortellis integration guide](#) for enumerating them from the subscription report.

**The shape of a call, therefore, is:** Authorization (OAuth2 client credentials) + Subscription-Id (which rooftop) + Department-Id (which module in that rooftop) + Request-Id (client-generated UUID, echoed back) [DOCUMENTED]. The event-relay AsyncAPI uses X-Request-Id instead [DOCUMENTED] ([Fortellis event relay AsyncAPI specification](#)). Note what this means operationally: **there is no single group-wide query**. Nine rooftops is nine subscription identifiers per application and nine department-ID sets, and any group-consolidated view is a client-side union you build yourself [INFERRED].

**The nine-rooftop inference, stated as an inference.** CDK has never published a rule that says nine rooftops equals nine company numbers. What is documented is: per-store Company IDs at the integration layer, per-store Department-ID sets, per-store CDK accounting logons, and a company-number dimension above the account number in the GL extract [DOCUMENTED] ([MindBridge's CDK general-ledger export procedure](#)). From that, nine company numbers under one tenant is the reading with the fewest assumptions [INFERRED] — but whether the group consolidates through a group chart of accounts or nine parallel ones is [UNVERIFIED].

### Why the architecture matters more than the feature list

On 19 June 2024 the BlackSuit ransomware group took CDK offline; a second intrusion the same evening forced a second full shutdown during recovery [DOCUMENTED] ([BleepingComputer on the BlackSuit attribution](#), [USA Today's incident timeline](#)). Roughly 15,000 North American dealerships lost sales paperwork, F&I, registration, service scheduling, repair orders, parts lookup, payroll and inventory simultaneously for about two weeks. TRM Labs traced ~387 BTC, about \$25M, to the attacker wallet on 21 June; CDK never confirmed payment [DOCUMENTED] ([CNN on the traced ransom](#)). Direct dealer loss estimates run from ~\$944M to \$1.7B [DOCUMENTED] ([aggregated incident-impact summary](#)).

The architectural point, not the news point: the DMS is simultaneously the system of record and the only access path to that record. There is no dealer-side standby, no read replica, no local copy of the ledger. Fifteen thousand independent businesses had no failover except paper. That is the whole design argument for a dealer-held twin, and it is an availability argument before it is an ownership argument.

## 02 The financial ledger — and what an accounting schedule actually is

Start with the constraint, because it determines the chart. Franchised dealers submit a monthly financial statement in a factory-defined format, which forces the dealer's chart of accounts to map onto factory-standard account numbers regardless of DMS [DOCUMENTED]. The documented exemplars are the [GM Dealer Standard Accounting Manual](#) and the [Ford Online Accounting Manual chart of accounts](#). **No PACCAR-specific dealer accounting manual or chart of accounts exists in public sources** [UNVERIFIED] — PACCAR Financial Services' wholesale financing and dealer credit monitoring are confirmed in the 10-K [DOCUMENTED] ([PACCAR 10-K, financial services segment](#)), and the requirement to submit a factory-format statement is [INFERRED] by analogy. Treat GM's numbering below as structure, not as PACCAR's actual account numbers.

| CONVENTION         | RULE                                                                                                                                            | EXAMPLE                                      |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| Natural account    | Three digits identify the natural account and its statement classification.                                                                     | 231 New Cars inventory                       |
| Department suffix  | Expense and many revenue accounts append a two-digit department code after a hyphen.                                                            | 013-01 Delivery Expense, New Vehicle         |
| Department codes   | 01 New Vehicles · 02 Used · 03 Lease & Rental · 04 F&I · 05 Mechanical/Service · 06 Body Shop · 07 Parts & Accessories · 09 G&A                 | —                                            |
| Sub-account letter | A letter splits an account for analysis, independent of department.                                                                             | 446A vs 446B Used Retail, certified vs other |
| Numeric ranges     | 200s assets · 300s liabilities and equity · 400s sales · 600s cost of sales · 700s lease/rental cost · 800s–900s other income, expense and F&I. | 600–618 New retail COGS                      |

All rows: [GM Dealer Standard Accounting Manual](#). [DOCUMENTED] as GM's structure; [INFERRED] as the industry pattern.

### Accounting schedules — the subledger mechanism, contrasted with SAP

A **schedule** is a subledger of open-item detail standing behind one GL balance, where the GL account itself carries only the summarised period total. The industry's own plain-English definition: "A schedule is simply a complicated report of accounting detail", and it clears "when the balance for the RO# (control) is zero after the month's end" [DOCUMENTED] ([Digital Dealer, 'Your DMS and Schedules'](#)).

The load-bearing concept is **control**. Each schedule-based account is declared to be controlled by a designated key field — RO number, stock number, customer ID, VIN last eight, reference or document number — and the DMS must know, per account, whether to demand that control number at posting time or derive it [DOCUMENTED]. This is not CDK-specific vocabulary: a competing DMS literally ships a setup field labelled "Schedule Controlled With" [DOCUMENTED] ([Autosoft dealership accounting setup manual](#)), another lists accounts "controlled individually by Cust#, Stock#, last8, Reference, VIN" [DOCUMENTED], and a third exposes per-account "Reporting Accounts" mapping [DOCUMENTED] ([Dominion DMS GL account setup](#)).

**The contrast, put the way it will land.** In SAP you have, in practice, two open-item subledgers — customers and vendors — reached through reconciliation accounts that cannot be posted to directly, with line detail in the customer and vendor line-item tables and clearing driven off the assignment field. GL open-item management exists but is the exception you switch on deliberately for a handful of clearing accounts. A DMS inverts that ratio: the control-account pattern is generalised to almost every balance-sheet account that carries open items — floor plan payable, factory receivables, warranty claims, contracts in transit, F&I chargebacks, service and parts work in process — because practically every dealership transaction traces back to a deal, a repair order or a parts ticket [DOCUMENTED] ([Digital Dealer on the control-account pattern](#)).

Two consequences you will care about. First, the **control key is the assignment field**, and matching a schedule to its GL balance is the same operation as clearing by assignment — except it is the routine monthly workload on a dozen accounts, not an exception. Second, **the reconciliation break is a named, bookable event, not an incident**. GM's manual carries an explicit entry for "the difference between the month-end schedule and the account balance" [DOCUMENTED] — which tells you the two artefacts are expected to disagree and be trued up. In an SAP shop that would be a reconciliation defect. Here it is a line in the manual.

| SCHEDULE                   | GL CONTROL ACCT (GM NUMBERING)                                | CONTROL KEY                 | CLEARING BEHAVIOUR                                                                                                                                                                      |
|----------------------------|---------------------------------------------------------------|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Warranty claims receivable | 263 Warranty Claims (Ford's equivalent: 1140)                 | RO / claim number           | Aged 30/60/90/120+, detail-forward; clears at zero balance. Debited on filing, credited only when the factory pays or rejects — so ageing is factory-controlled, not dealer-controlled. |
| New vehicle floor plan     | 231 New Cars (asset) against 310 Notes Payable – New Vehicles | Stock # / VIN last 8        | Read side by side against inventory; flags units still floored after sale.                                                                                                              |
| Factory receivables        | 261 Factory Receivables                                       | Claim / programme reference | Reconciled monthly <b>to the OEM's own statement</b> , not internally. Holdback, incentives.                                                                                            |
| Contracts in transit       | 205 Contracts in Transit                                      | Deal / contract #           | Clears on lender funding.                                                                                                                                                               |
| Service and parts WIP      | 247 Work In Process – Labor, plus parts WIP accounts          | RO #                        | Clears when the RO closes and invoices. Labour on open ROs must reconcile monthly, variance to a labour adjustment account.                                                             |

Rows sourced to [the GM manual](#) and [Digital Dealer](#). [UNVERIFIED]: CDK Drive's own schedule numbers and internal schedule names are not published anywhere. There is no CDK equivalent of Ford's "1140" on the record, and no public CDK document names a schedule export.

## Journals, periods, and statements

**Journals map cleanly to document types.** The named journals a DMS posts into are enumerable: Standard Entries, Cash Receipts, Cash Disbursements, Purchase, Payroll, New Vehicle Sales/Purchase, Used Car Sales, Internal Sales, Service Sales (cash/charge), Warranty Sales, Parts Sales (cash/charge), Dealer Exchange, Statistical Data, General Journal Entry [DOCUMENTED] ([GM manual journal list](#)). A worked example: floor plan interest accrual debits 076-01 and 076-02 Interest Floorplan by department and credits 320 Interest Payable through the Standard Entries Journal [DOCUMENTED] ([GM account 076, Interest Floorplan](#)). Note that floor plan interest is **expensed, not capitalised into unit cost** [DOCUMENTED] — which distinguishes it from the carrying costs you would normally expect to see land on the cost object. A DMS journal-entry header carries a document number, a journal type/number, a period, and an optional schedule/control reference to clean or adjust [DOCUMENTED] ([Autosoft journal entries manual](#)).

**Posting-period lock is a hole.** No CDK screen, table or transaction name for closed-period enforcement appears in any public source [UNVERIFIED]. The general DMS/ERP behaviour — subledgers blocked from posting back into a closed period, corrections entered as current-period reversals — is [INFERRED] from adjacent systems only. You know this control as the posting-period variant; assume the capability exists, do not assume you can name or audit it.

**One chart, several presentations.** The factory statement is produced by mapping every live GL account to a manufacturer-defined standard account number, independent of internal numbering: "Assign all your General Ledger accounts to standard account numbers which correspond to the account numbers on the manufacturer's forms" [DOCUMENTED] ([SDS formatted financial statement documentation](#)), and the same ledger prints the formatted factory statement, the trial balance and a dealer values report as three distinct outputs. That is a financial statement version in all but name. What is not documented is any CDK screen that emits a labelled GAAP or ASPE statement [UNVERIFIED] — the OEM statement is a compliance artefact keyed to the manufacturer's own line definitions, and the ASPE statements Peterbilt Atlantic files are produced by its accountant off the same ledger with different treatment of LIFO and consolidation [INFERRED].

**Close sequence,** reconstructed from account-by-account reconciliation instructions rather than from a published runbook [INFERRED]: cut off all subsidiary schedules for the period; reconcile every controlled schedule to its GL account and post adjusting entries for variances; reconcile factory receivable, holdback and incentive accounts **to the OEM's statement**; post inventory valuation and LIFO adjustments; trial balance; generate and transmit the factory-formatted statement [DOCUMENTED] for the individual steps ([GM manual reconciliation instructions](#)). A Peterbilt-branded rooftop on a competing DMS is publicly documented closing in three standard working days [DOCUMENTED] ([Procède customer story, Peterbilt of Atlanta](#)) — useful as the network's expectation of close speed. The CDK screen name for the submission step itself is [UNVERIFIED].

**Floor plan and curtailment.** Advances repay as inventory sells, with a curtailment provision requiring periodic principal reductions on stale inventory, set either in the bank-dealer loan agreement or the manufacturer-dealer agreement [DOCUMENTED] ([OCC Comptroller's Handbook on floor plan lending](#)). PACCAR Financial Services runs floating-rate wholesale loans to PACCAR dealers [DOCUMENTED]. No CDK-specific curtailment or floor plan GL account numbers are public [UNVERIFIED].

### 03 Cost objects — department, repair order, absorption

A dealership is one legal entity operated as a set of internal mini-P&Ls. The standard department set is New Vehicle, Used Vehicle, Parts, Service, Body Shop, Rental/Lease, F&I, and Administrative/Overhead; Service, Parts and Body Shop are collectively “Fixed Operations” [INFERRED]. Every department except Administrative carries its own sales, cost of sales, gross and direct expense block — a profit centre with a mini income statement inside one company code. Administrative is a pure cost pool. That the department is the industry's unit of P&L measurement rather than an internal convention is [DOCUMENTED]: NADA's own 20 Group product exists to analyse “profitability, expense absorption and employee productivity across each dealership department” (NADA 20 Group).

**The carried dimension is** Department -Id, mandatory on every accounting-type call and filtering the response [DOCUMENTED] (Get Customer v3 header definition). By dealer-accounting convention it is on every journal line the way a cost centre is mandatory on every FI/CO line [INFERRED]. **The host-side field name for the department dimension on a raw GL posting line is not public** [UNVERIFIED] — only the externally exposed header is. The closest documented analogue on a comparable DMS is a per-account Schedule Index (0 no schedule, 1 vehicle inventory, 2 A/R, 3 A/P, 4 misc balance-forward, 5 misc detail-forward, 6 combination) that routes each subsidiary posting to the right department/schedule pair [DOCUMENTED] on that system, [INFERRED] for CDK (Autosoft accounting setup).

**The repair order is an internal order. Say it plainly.**

CDK's Get Repair Order v3 schema carries three boolean pay-type flags on every RO header — hasCustPayFlag, hasIntPayFlag, hasWarrPayFlag [DOCUMENTED] (CDK Drive Get Repair Order v3 specification) — and each job line independently carries a pay type, so one RO splits across three revenue and receivable streams at once [DOCUMENTED]. The RO is therefore a temporary, self-contained cost collector that accumulates several cost elements against one header number, is closed out and settled once, and settles to different final targets according to a type field. Pay type plays the role your settlement rule plays. Calling it an internal order is not a metaphor; the only thing missing is a settlement profile you can inspect.

| PAY-TYPE FAMILY               | CODES SEEN                                                                                                                    | SETTLEMENT TARGET                                          | SAP-SHAPE RECEIVER                                                                                 |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| Customer pay / service retail | CP*, SR*                                                                                                                      | “ANY CUSTOMER ACCOUNT” — open trade A/R                    | Customer reconciliation account, cleared by RO reference                                           |
| Warranty, by claim payer      | W*, SW* — e.g. WCM Cummins, WNA Navistar                                                                                      | Warranty-company control accounts, e.g. &WARCMN, &WARNAV   | One receivable subledger per claim payer, not one warranty account                                 |
| Internal, by purpose          | I service policy, ICV company vehicle, IDU demo unit, IGP goodwill policy, IPW parts warranty / shop supplies, IUB trade unit | Internal cost pools, e.g. &100SPA / 101SPA, &CVNEW, &NBPOL | Settlement to an inventory or asset receiver — the vehicle stock number, or an expense cost centre |

**Provenance caveat, read it before you quote the codes.** The forty-plus code list and the ampersand-prefixed control accounts come from a live dealer's own CDK service-type reference sheet [DOCUMENTED] (CDK service-type reference, Leonard Bus Sales). They are real, printed, and verifiable — but they are that dealer's configuration, not a published CDK global standard. Expect Peterbilt Atlantic's own code table to differ in membership while matching in shape. The three-way split itself is confirmed independently across the industry as customer pay / warranty / internal [DOCUMENTED] (Autosoft repair orders guide), and parts consumed on an RO carry a transaction-code suffix that mirrors the parent line's pay type [DOCUMENTED] (CDK transaction codes reference).

**WIP behaviour.** The RO bears WIP until it closes: labour on open ROs reconciles monthly to account 247, variance to a labour adjustment account [DOCUMENTED] (GM manual, warranty claim labour accounts). CDK's own API models the lifecycle explicitly — getOpenRepairOrdersBulk, getWIPRepairOrders (opened, voided or closed in the past 48 hours), getClosedRepairOrdersBulk and its delta [DOCUMENTED] (Get Repair Order v3). Parts and labour hit a WIP suspense account at the parts billing run — **before** the RO closes and before the customer is invoiced; on close, WIP nets to zero and reclassifies to revenue and COGS, and tax and discounts are realised only at close [DOCUMENTED] on a comparable DMS, [INFERRED] for CDK (IntelliDealer work-in-process reference).

**Technician time.** Captured at RO line level in tenths of an hour — a trainer entering “120” for 1.2 hours — and correctable by amount independently of hours via a change-sale-amount command [DOCUMENTED] (CDK dealer training walkthrough, closing a customer-pay RO). Flat-rate hours come from op-code time standards exposed through the OpCodes API [DOCUMENTED] (CDK Drive OpCodes API reference) — but **the field name for standard hours is not published**: whether it is called flat-rate hours, book time or something else is [UNVERIFIED], and I will not guess it. Efficiency (sold ÷ clock hours) and proficiency (sold ÷ available hours) are [INFERRED] formulas computed downstream; whether CDK exposes them as calculated fields is [UNVERIFIED]. Labour cost lands as cost of sales split by the same pay type; technician incentive pay is

charged to cost of labour sales while non-productive pay is excluded and expensed [DOCUMENTED].

**Internal work between departments.** Recon and PDI open as an internal RO, and the receiving cost object is **the vehicle stock number, not a customer account** — documented explicitly on a comparable DMS (“use the vehicle's stock number as the customer number”) [DOCUMENTED] ([Autosoft repair orders guide](#)) and corroborated on CDK by its Display Vehicle Cost screen, which shows real-time GL items “including any open Purchase Orders or Repair Orders and their amounts” with drill-down to the postings [DOCUMENTED] ([CDK Display Vehicle Cost screen documentation](#)). So the vehicle inventory record is a running WIP cost collector settling to inventory — a WBS element or internal order settling to a material, in your terms. Two things are [UNVERIFIED] and both matter: the breakdown inside that roll-up (acquisition, pack, recon labour, recon parts, floor plan interest are not separately named on the help page), and whether CDK posts an explicit elimination entry for internal work or simply nets the two departmental lines through the vehicle inventory schedule.

### Overhead allocation and absorption

Overhead is allocated from the administrative pool to revenue departments on dealer-defined prorate methods — gross-profit share, square footage, headcount, or a fixed historical split set by the principal and revisited periodically [INFERRED] ([GM manual](#) for the account structure; [NADA](#) for the benchmarking frame). That is an assessment or distribution cycle pushing cost-centre balances onto profit centres, run on judgement rather than on a cycle definition you can version.

**Absorption rate is the number the principal actually watches.** Two published definitions [DOCUMENTED] ([NADA/ATD Slide Guide, fixed absorption](#), [2026 NADA Slide Guide](#)):

**Total absorption** = used-vehicle + service + parts + body shop gross profit ÷ total dealership expense. Guide: 100%.

**Fixed absorption** = total fixed gross profit ÷ total dealer expense, excluding lease and rental, less new- and used-sales commissions and delivery and policy expense. Guide: 60%. Reported national average 63.9% as of August 2025 [DOCUMENTED] ([absorption rate benchmark compilation](#)).

At 100% absorption every dollar of new, used and F&I gross is incremental profit, because fixed operations already covers all overhead. It answers whether the store survives a bad sales month. **Architecturally it is a report, not an object** [DOCUMENTED] — computed on top of departmental gross and overhead figures, never stored as a GL account or a journal entry. In the twin it belongs in the reporting layer derived from posted department and RO data, not as a persisted attribute. Manufacturer variants adjust the denominator, and whether PACCAR dealers benchmark through NADA's ATD composite or a PACCAR-proprietary equivalent is [UNVERIFIED] ([ATD Data](#)).

## 04 Materials management — parts master, valuation, movements, OPC

This is the lane where CDK is most legible to you, because the object model really is materials management. It is also the lane where the twin already exists in SAP shape [DOCUMENTED] ([the eve-dealer-parts-twin repository](#)), so the findings below are corrections and additions rather than a fresh mapping.

**Master and function codes.** The parts master is maintained through PM (Parts Maintenance); inquiry is PRO/PDA [DOCUMENTED]. CDK publishes no single formal data dictionary, so real attribute names surface in three places only: the Get Repair Order v3 parts array, the Async Parts Inventory field list, and the STAR PartsProductItem component that DMS vendors map to. Confirmed names: number, desc, bin1 (“the main bin number”), source, partClass [DOCUMENTED] ([Get Repair Order v3 parts array](#)); and from Async Parts Inventory: PartNumber, Description, Manufacturer, QtyOnHand, BinLocation, Cost, ListPrice, LastSaleDate, DateReceived, DeletePartFlag, GroupCode, MinStock, MaxStock, SafetyStock [DOCUMENTED] ([Fortellis community Q&A on Async Parts Inventory and pick ticket](#)). Alternate bins BIN1/BIN2 are set through PM, with batch relocation, and a Sort Key orders bin sheets [DOCUMENTED] ([dealer-forum thread on CDK bin fields](#)).

**Supersession is a chain, not a pointer — fix this in the twin.** Function PN drives supersession and “Undo Succession” reverses it; a superseded part auto-redirects the order or sale to the new number, and a part can be superseded repeatedly [DOCUMENTED] for the behaviour and function name ([dealer-forum thread on CDK auto-supersession](#)). **The internal field or table name for the chain pointer is** [UNVERIFIED]. A single supersession\_to column cannot represent multi-hop chains or regional dual-number branches; the twin needs a child table keyed from-part, to-part, effective date, sequence.

## Valuation — the trap in one sentence

Every monetary field CDK returns on a repair-order parts line is described as **escalated**: cost is “the escalated unit cost amount”, list “the escalated unit list price”, sale the escalated unit sale price excluding core and unit service charge, alongside extendedCost/extendedSale, coreCost/coreSale, mcdPercentage (“the percentage applied on the split part”) and unitServiceCharge [DOCUMENTED] ([Get Repair Order v3 parts line fields](#)).

So the number on the transaction is **not** the moving average — it is the point-of-sale escalated cost. Whether CDK exposes a raw average or replacement cost separately is [UNVERIFIED]; the public schema documents only the escalated value. The consequence for the twin is concrete: the valuation record and the material document must carry different cost fields, and reconciling them is a real reconciliation, not a rounding difference. Cross-vendor evidence says the underlying model is average-with-replacement-fallback — a heavy-truck DMS documents AverageCost as “the average cost or, if average cost is zero, the replacement cost” with ReplacementCost as a distinct field [DOCUMENTED] ([Karmak Unity parts inventory API](#)), and pricing matrices are basis-driven on average cost, replacement cost or list [DOCUMENTED] ([Motility parts and service pricing matrix](#)).

**Cores.** CDK distinguishes clean from dirty core returns at credit-memo entry, and a dirty-core inventory report tracks per-part core count and dollar value awaiting return [DOCUMENTED] ([dealer-forum thread on CDK core tracking](#)). A paid “core bank” feature exists; without it, dealers reconcile month-end core credits against factory invoices by hand [DOCUMENTED] ([dealer-forum thread on the CDK core bank feature](#)).

## Movement types — CDK transaction codes to bwart

| MOVEMENT                      | CDK EVIDENCE                                                                                                                                             | MAPPING                                                                                                                    | STATUS                                   |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|------------------------------------------|
| Receipt against PO            | Receipt increases on hand; PACCAR flow confirms order → receipt via ePortal and an electronic shipping notice                                            | 101                                                                                                                        | norm plus documented ASN flow [INFERRED] |
| Counter sale                  | PS code; blank/N normal sale or return, H/NH wholesale                                                                                                   | 601                                                                                                                        | CDK code printed [DOCUMENTED]            |
| Issue to repair order         | w/NW warranty sale or return on an RO warranty-pay labour line; DS/DW warranty drop-ship                                                                 | 601 with the order number populated                                                                                        | CDK code printed [DOCUMENTED]            |
| Return to vendor              | Dirty-core processing and reconciliation; STAR publishes a named Parts Return – Obsolescence interface specification                                     | 161                                                                                                                        | standard name documented [DOCUMENTED]    |
| Transfer between sites        | Intercompany parts transfer and inquiry is a standard DMS-class feature; CDK’s own inter-store mechanics beyond store-code visibility are not documented | 301 or 311                                                                                                                 | mechanics not documented [UNVERIFIED]    |
| Physical inventory adjustment | M minus adjustment, P plus adjustment                                                                                                                    | 701 / 702                                                                                                                  | CDK code printed [DOCUMENTED]            |
| Obsolescence write-down       | No CDK transaction code found; an accounting-side entry only                                                                                             | <b>No movement type applies.</b> Value-only posting against valuation and the GL, no quantity document                     | no CDK code [UNVERIFIED]                 |
| Lost sale                     | Quantity followed by LO on a line when on-hand is zero; code L = “true lost sale, not lost sale due to price”                                            | <b>No movement type applies.</b> A demand signal, not an inventory event — needs its own fact table, not a forced movement | CDK code printed [DOCUMENTED]            |

Codes from [the CDK transaction-codes reference](#), cores from [the CDK core-tracking thread](#), lost sales from [the CDK lost-sales thread](#). The two “no movement type applies” rows are the ones that break a naive mapping: forcing either into a material document corrupts both stock and demand history.

**Ordering.** IRO sets stocking parameters per source including phase-in and phase-out; IRE generates the suggested stock order; PO posts manual orders; RMR lists manual-order-flagged parts with activity since the last stock-order run [DOCUMENTED] for the function names ([dealer-forum thread on the CDK suggested stock order](#), [thread on CDK automatic phase-out](#)). Min, max, safety stock and days-supply live in the same setup [INFERRED].

**PACCAR-side ordering — get the name right.** The dealer ordering platform is **Online Parts Counter (OPC)**, reached through PACCAR's ePortal, offering 24/7 access to over 1.4 million parts, visibility to dealer inventory, part cross-referencing and market-basket pricing [DOCUMENTED] ([PACCAR Parts customer service page](#), [PACCAR ePortal and Fleet eCat user guide](#)). **"PartsPRO" does not appear in any public PACCAR source and should not be used** [UNVERIFIED] — the original brief's term is wrong. Managed Dealer Inventory (MDI) is the daily automated recommendation: PACCAR Parts analyses retail sell-through and transmits order recommendations per dealer location electronically, daily [DOCUMENTED] ([PACCAR Parts technology page](#)). Confirmed order types, from a competing DMS's PACCAR integration page: **Stock, Emergency, Marketing Suggestion (MKT), Auto Confirmed (COF)** [DOCUMENTED] ([Karmak's PACCAR integration page](#)). A formally named vehicle-off-road order type in the North American programme is [UNVERIFIED] — the terminology is used by PACCAR Parts operationally in Australia, but it is not among the four named codes. Do not code a fifth order type on an assumption.

**Counting and obsolescence.** There is **no named CDK cycle-count function** in public sources [UNVERIFIED]; practice is rotational bin checks, with bin sheets generated page-per-bin for a full physical, and a Parts Events report filterable by changed field showing who altered a bin or quantity [DOCUMENTED] for the report path ([dealer-forum thread on the CDK bin-changed report](#)). Obsolescence: the industry trigger is twelve months with zero movement [DOCUMENTED] ([McDonald Group on eliminating obsolete inventory](#)); a common graduated reserve scales with trailing-twelve-month demand multiples (0% to 1x, 25% 1–2x, 50% 2–3x, 75% 3–4x, 100% above) [INFERRED] ([CLA on reasonable inventory reserves](#)). Treatment is lower of cost or market for LIFO/retail, lower of cost or net realisable value for FIFO/average-cost post-ASU 2015-11, and under US GAAP the write-down is **irreversible** even if value recovers [DOCUMENTED] ([ASC 330 write-down summary](#)). **No PACCAR dealer-facing obsolescence allowance or buy-back percentage exists in public sources** [UNVERIFIED] — the only PACCAR obsolescence cadence on the record is supplier-facing, quarterly, with a 120-day clock.

## 05 Master records — keys, and the duplicate problem

Four masters matter and they are documented to wildly different depths. Customer is documented field by field. Vehicle exists as two separate objects that must be explicitly linked. Employee has no published master at all — identity is embedded on transactions. Vendor has no published schema whatsoever.

| MASTER                     | KEY                                                     | SCOPE                                                                                                  | EVIDENCE DEPTH                                                                                                              |
|----------------------------|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| <b>Customer</b>            | customerId, also documented as hostItemId               | Store- or department-scoped, not tenant-global [INFERRED]                                              | Full field tables published for Get Customer v3 and the CRM v1 read/write API [DOCUMENTED]                                  |
| <b>Vehicle (service)</b>   | vehicleId / vehId, with identification.vin              | VIN is globally unique by definition; the DMS identifier sits on top [DOCUMENTED]                      | Field list published via the connector documentation [DOCUMENTED]                                                           |
| <b>Vehicle (inventory)</b> | Stock number                                            | Explicitly store-scoped: ranges configured per Location, Inventory Type and Acquired Type [DOCUMENTED] | Setup screens documented; <b>stock number is absent from the service-vehicle schema</b> [DOCUMENTED]                        |
| <b>Employee</b>            | Numeric technician, advisor, cashier and booker numbers | Store-scoped [INFERRED]                                                                                | <b>No master schema published.</b> Name of an extract API confirmed via an announcement only [UNVERIFIED]                   |
| <b>Vendor</b>              | —                                                       | —                                                                                                      | Existence confirmed (a vendor workflow, an AP payments integration). <b>No field names at all.</b> [UNVERIFIED]             |
| <b>GL account</b>          | Account number under a company number                   | Company number groups GL data per rooftop [DOCUMENTED]                                                 | Existence and the company-number dimension confirmed via an audit-analytics export procedure; <b>no schema</b> [UNVERIFIED] |

Customer APIs: [Get Customer v3 at cdk/drive/customer/v3](#) (read) and [the CDK Drive Customers API at cdkdrive/crm/v1/customers](#) (search, create, update). Vehicle: [CDK Drive Service Vehicles connector documentation](#) and [the Stock Number Definition setup screen](#). Employee identifiers: [Get Repair Order v3](#) and [the CDKDrive Repair Orders v1 developer guide](#). GL: [the CDK general-ledger export procedure](#) and [the Account Mapping setup screen](#).

**Customer master, worth knowing in detail.** CDK defines a customer as someone sold a vehicle, prospecting, buying parts, or having a vehicle serviced [DOCUMENTED]. Individual and business are mutually exclusive: populate first and last name, or company name, never both [DOCUMENTED]. Note what sits on the master rather than in finance: balances, creditLimit, currentDue, and an overDues object with 30/60/90/120+ buckets [DOCUMENTED]. In your frame that is credit master and ageing data denormalised onto the business partner. Parts classification is carried as partsFlag, partsType (w

= wholesale) and partsCounterCode; serviceCustomer = S marks a service-only, non-AR/parts customer [DOCUMENTED].

### Consent — a real gap for an Atlantic Canada dealer

The documented consent surface is three booleans plus two flags: blockEmailFlag, blockMailFlag, blockPhoneFlag inside contactMethods, plus optOutFlag (sale or sharing of personal information) and isDeleteDataFlag with delete date and time — the latter two named in the schema against **CCPA**, a US statute [DOCUMENTED] ([Get Customer v3 contact and privacy fields](#)). CASL, which is what actually binds Peterbilt Atlantic, requires the sender to prove consent per message: express consent (explicit, does not expire until withdrawn, must be provable) or implied consent (arising from an existing business relationship, time-limited, lapses). The regulator's position is that “the onus is on the person who alleges they have consent... to prove that they have proper consent”, with retention of the evidence, the collection method, the policy, and every unsubscribe request and the action taken [DOCUMENTED] ([CRTC enforcement advisory on keeping records of consent](#)).

**Boolean flags cannot satisfy a record-keeping obligation.** CDK's public customer schema documents no consent timestamp, no consent source, and no expiry — so it answers “may we contact them” but not “when and how did we get permission, and has it lapsed”, which is exactly what CASL demands [DOCUMENTED] as a gap by omission, [INFERRED] as to consequence. On the public schema alone, a Canadian dealer needs a supplementary, timestamped consent log per channel outside the DMS. Whether Canadian CDK dealers in fact repurpose optOutFlag for CASL or rely entirely on external layers is [UNVERIFIED].

### Vehicle — two objects, one link step

The service-side vehicle record carries vehicleId, identification.vin and licensePlateNum (“at least one of the identification properties must be defined”), a specification block, mileage as a value/units object, status limited to new, used or certified, dates.delivered / inService / warrantyExpiration, and — importantly — ownerHref and primaryDriverHref as hyperlinks to the customer resource rather than an embedded customer object [DOCUMENTED] ([Service Vehicles field documentation](#)). **Stock number is not in that schema**; it belongs to the inventory record, is configured per Location, Inventory Type and Acquired Type, and can be changed independently of VIN [DOCUMENTED]. Third-party integration guidance shows the add-unit workflow requiring stock number, inventory type and VIN, then a separate step to push the vehicle into the service-domain record [DOCUMENTED] ([third-party CDK inventory process guide](#)) — direct evidence these are two objects with an explicit link, which is where orphaned records come from. Wholesale is not a documented vehicle status; it appears at customer level as a parts type and at inventory level as an acquired type [DOCUMENTED], and a distinct wholesale inventory status field is [UNVERIFIED]. Heavy-truck specifics — chassis number distinct from a dealer unit number, and a body-builder record for the completed spec — are [INFERRED] from truck-industry practice; **CDK publishes no heavy-truck field names for any of it** [UNVERIFIED].

### Employee — identity lives on the transaction

There is no published employee master. What exists is a dense set of employee references inside the repair order: serviceAdvisor, cashier (the employee ID who closed the RO), bookerNo, line.storyEmployeeNo, technicianIds[] (literally “MULT” when more than one), comebackSA and comebackTech carrying the original RO's advisor and technician on a comeback, per-split hours[].technicianId, parts[].employeeId, outsideSalesmanId, technicianPunchTimes[] with a workType code, and discounts[].userId/appliedBy [DOCUMENTED] ([Get Repair Order v3 employee references](#)). Dedicated lookups exist for technicians and service advisors [DOCUMENTED] ([Repair Orders v1 developer guide](#)). **The comeback fields are worth noticing**: warranty-of-workmanship exposure is modelled on the document, which means it is measurable without a separate quality object. Payroll is a module CDK sells [DOCUMENTED] ([CDK Payroll Plus](#)), and commission platforms integrate against report outputs rather than an employee API [DOCUMENTED].

### The duplicate problem, multiplied by nine

Duplicates are the chronic DMS data-quality failure and the cause is procedural: front-line staff — cashiers, credit-bureau lookups, F&I — create a new customer number instead of searching for the existing one. Merge rules key on which record has more recent sale or service activity or an active assigned salesperson, and the merge routine consolidates deal, RO and parts-ticket history onto the surviving identifier [INFERRED] ([Digital Dealer on cleaning a duplicated customer database](#)). Practical dedup keys on last name plus phone plus postal code, secondarily email, because VIN and deal history only attach after the duplicate exists. **CDK documents no automated or fuzzy-match dedup API** [UNVERIFIED] — merge is a screen-driven action.

**Now the nine-rooftop multiplier.** Every key in the table above is evidence-consistent with per-store or per-department scoping rather than per-tenant: customer numbering, stock-number ranges, technician numbers, company numbers. Whether customerId is unique per company number or can be shared across rooftops in one tenant is **not stated in any source found** [UNVERIFIED]. If it is store-scoped, the same fleet customer transacting at four of the nine sites holds four unrelated customer identifiers, four credit limits and four ageing profiles, and no single rooftop's ledger shows the group exposure. That is not a data-hygiene annoyance; for a group whose best customers are multi-site fleets it is a credit-control defect. **This is the single question I would put to CDK in writing first**, because the answer determines whether the twin needs a group-level golden-record layer or merely a reconciliation view.

## 06 Document flow by functional unit — what posts, and when

Order to cash and procure to pay, drawn the way you would draw them, with the posting moment called out. Where the posting moment is inference rather than documentation it is marked, because the difference matters when you are deciding what the twin can reconstruct.

| UNIT                             | CHAIN                                                                                                                                                                                                                                                                    | POSTS AT                                                                                                                                                                                                                    | STAYS IN A SCHEDULE                                                                                                                                                                                                             |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Vehicle sales / deal desk</b> | Customer → desk worksheet → Pending → We-Owe → Finalized / Booked. The deal must balance — all debits and credits net to zero, the “washout” — before it closes. Status vocabulary confirmed: Pending, Finalized/Booked; We-Owes is a named extract object. [DOCUMENTED] | At delivery: unit cost out of inventory, sale revenue, F&I product revenue net of reserve, trade into used inventory at appraised value, lien-payoff liability cleared once wired. [INFERRED]                               | Contracts in transit, factory holdback and incentive receivables, F&I reserve and chargeback receivable, we-owes. Holdback sits <b>outside</b> front-end gross, booked as other income against a factory receivable. [INFERRED] |
| <b>Service</b>                   | Appointment → RO opened → service lines (labour ops plus pre-assigned parts) → dispatch (jobStarted per line) → parts pick ticket → additional service request and authorisation → invoice → payment settling → close. [DOCUMENTED]                                      | <b>WIP posts at the parts billing run</b> — before close and before the customer is invoiced. At close: labour revenue, parts revenue, sublet cost, parts COGS, WIP cleared to zero, tax and discounts realised. [INFERRED] | Service and parts WIP against the RO number until close. [DOCUMENTED]                                                                                                                                                           |
| <b>Parts counter</b>             | Open parts sale = counter or pick ticket in progress, inventory allocated, not yet invoiced. Closed parts sale = invoiced and posted. The open/closed split is explicit in the async API pair. [DOCUMENTED]                                                              | On close: parts revenue and COGS at the escalated point-of-sale cost. [DOCUMENTED]                                                                                                                                          | Counter charge sales into parts A/R. [INFERRED]                                                                                                                                                                                 |
| <b>Warranty</b>                  | RO → draft claim created in PACCAR's warranty system from RO data → OEM submission → status screen. One-directional. There is no generic warranty CRUD API. [DOCUMENTED]                                                                                                 | Receivable booked at expected reimbursement on submission; adjusted on payment, reduction or chargeback. [INFERRED]                                                                                                         | Warranty claims receivable, aged by RO or claim number, reconciled monthly to the factory statement. [DOCUMENTED]                                                                                                               |
| <b>AR and cashiering</b>         | Payment Settling API only: PayNow at the counter, Invite-2-Pay remotely. Returns a promise identifier to poll; a settlement cannot exceed the amount owed; posts back within seconds. Settles against repair orders and parts orders. [DOCUMENTED]                       | Cash clearing on receipt; bank on confirmation. [INFERRED]                                                                                                                                                                  | Vehicle, parts/service/body, and other AR ageing as distinct balance-sheet lines. [DOCUMENTED]                                                                                                                                  |
| <b>AP and purchasing</b>         | Accounts Payable and multicompany accounting exist as modules; a General Ledger Inquiry Workflow is described as available for limited dealer testing. <b>No public spec names a vendor invoice or purchase order object.</b> [DOCUMENTED]                               | Invoice on approval; goods receipt on ASN receipt. [INFERRED]                                                                                                                                                               | Trade payables; OEM parts payable reconciled against electronic invoices. [INFERRED]                                                                                                                                            |

| UNIT           | CHAIN                                                                                                                                                                                             | POSTS AT                                                                              | STAYS IN A SCHEDULE                   |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|---------------------------------------|
| <b>Payroll</b> | Flag hours accumulate from closed-RO labour time; a technician payroll report is reconciled per period, then a payroll lock finalises it so time cannot be re-flagged into the period. [INFERRED] | Payroll journal pushed into the CDK GL by the external payroll provider. [DOCUMENTED] | Accrued payroll, commission reserves. |

Sources by row: deal status vocabulary from [a dealer integrator's DMS status cheat sheet](#) and we-owes from [CDK's own Partner Program price guide](#); RO lifecycle from [the Repair Orders v1 developer guide](#) and [Get Repair Order v3](#); WIP timing from [a comparable DMS's work-in-process reference](#); parts open/closed from [CDK's parts API page](#); warranty from [CDK's Heavy Truck OEM page](#); cashiering from [the Payment Settling API announcement](#) and [its product page](#); AP from [CDK's Accounting Workflows page](#) and [the Foundations Suite description](#); payroll from [the ADP Workforce Now CDK outbound integration](#) and [Workzoom's automotive payroll notes](#); AR ageing structure from [the Ford accounting manual balance-sheet section](#).

**Two flow facts worth arguing about tomorrow.** First, warranty leakage is material enough that CDK sells a consulting programme against it — a Warranty Revenue Assistance Program aimed at reimbursement rates and approval speed [DOCUMENTED] ([CDK on warranty reimbursement and WRAP](#)). A vendor monetising the recovery of your own receivable is a strong signal about how well the receivable is managed by default. Second, three-way match inside CDK AP is **not documented anywhere** [UNVERIFIED]. A competing heavy-truck DMS advertises exactly that for PACCAR electronic invoices — invoices imported and compared to purchase orders and receipts, then auto-posted to AP [DOCUMENTED] ([Karmak's PACCAR integration](#)) — which establishes it as an expected capability in this vertical without establishing that CDK has it. CDK's own Electronic Shipper integration for reconciling PACCAR parts shipments was a stated roadmap item, not a shipped API [DOCUMENTED].

## 07 The API reality — bluntly

This is the section to read twice. The gap between what CDK markets as an API platform and what you can actually post to or pull from is large, and it falls precisely across the boundary that matters to a finance architect.

| FUNCTIONAL UNIT           | REACHABLE VIA API                                                                                                                                                             | EXPORT OR FILE ONLY                                                                                                                                                                            | VERDICT                                                           |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| <b>Service / RO</b>       | Full lifecycle. Open, WIP and closed bulk and delta; service-line create, update, query, delete; op codes; service appointments; payment settling. [DOCUMENTED]               | Multi-point inspection, sublet detail, quality-control sign-off — no dedicated endpoint found. [UNVERIFIED]                                                                                    | <b>Genuinely usable.</b> The only unit you could operate against. |
| <b>Parts</b>              | Get and history-setup parts sales, async open and closed parts sales, pick ticket search, async parts inventory. [DOCUMENTED]                                                 | Special-order header fields, counter-ticket detail. Field-level schemas for the Get/History parts APIs are not published — the marketing page names them without publishing them. [UNVERIFIED] | <b>Adequate for stock and sales, thin on documents.</b>           |
| <b>Customer / vehicle</b> | Read and write on customers; service vehicles create, update, query; vehicle specifications read. [DOCUMENTED]                                                                | Merge and dedup.                                                                                                                                                                               | <b>Workable.</b> The best-documented schemas in the estate.       |
| <b>Deals / F&amp;I</b>    | Read-only extract of already-finalized deals: history setup, bulk, delta, with statuses C, B, P, F, I, U. [DOCUMENTED]                                                        | Desking, washout screen, we-owe line detail, menu selling. A Deals spec is referenced from another API's documentation but no public spec was located. [UNVERIFIED]                            | <b>Read-only rear-view mirror.</b> No write path.                 |
| <b>Accounting / GL</b>    | Two named POST endpoints: cdk/drive/glwipost/startWIP and cdk/drive/glpost/startWIP. Plus a marketed extract bundle covering accounting and general ledger data. [DOCUMENTED] | Chart of accounts, schedules, trial balance, statements — <b>no API is listed for any of them.</b> [UNVERIFIED]                                                                                | <b>A posting hole with a read shim.</b> See below.                |
| <b>Warranty</b>           | PACCAR draft-claim creation from an RO, on Fortellis. PACCAR-specific and one-directional. [DOCUMENTED]                                                                       | Adjudication, chargeback detail — portal only. [DOCUMENTED]                                                                                                                                    | <b>OEM-specific only.</b> No generic warranty object.             |
| <b>AR / cashiering</b>    | Payment settling only. [DOCUMENTED]                                                                                                                                           | Deposits, statements, daily deposit reconciliation. [INFERRED]                                                                                                                                 | <b>One narrow endpoint.</b>                                       |

| FUNCTIONAL UNIT | REACHABLE VIA API | EXPORT OR FILE ONLY                                                                                                                                                                                               | VERDICT        |
|-----------------|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|
| AP / vendor     | Nothing found.    | Vendor invoice entry, PO matching. No public API. <a href="#">[UNVERIFIED]</a>                                                                                                                                    | <b>Absent.</b> |
| Payroll         | Nothing found.    | Universally file export and GL push through third-party payroll vendors; one vendor states flag-hour import is file-based, with API integration only "scoped during implementation". <a href="#">[DOCUMENTED]</a> | <b>Absent.</b> |

### The accounting endpoints deserve a paragraph of their own

Both GL posting endpoints are real and correctly named — I am not inventing them. But look at what the only public evidence for them is: a Fortellis community support thread in which a developer, following CDK's own developer guide, was given the **wrong resource URL** and had to be corrected by CDK support to `cdk/drive/glwipost/startWIP`; and the sibling `cdk/drive/glpost/startWIP` returning "Invalid SubscriptionId or Implementation provider is not configured", later shown as inactive for that subscriber [\[DOCUMENTED\]](#) ([Fortellis community thread on API integration response errors](#)).

There is **no published request or response schema** for either — no journal line fields, no period fields, no document-type semantics [\[UNVERIFIED\]](#). The spec page did not resolve. So the honest position is: the general ledger can, in principle, be posted to by an external caller through something analogous to a document-posting BAPI, but you cannot design against it today, you cannot estimate against it, and you would be provisioning-blocked before you were schema-blocked. Everything else in accounting — chart of accounts, the schedules that carry the actual open-item detail, the trial balance, the statements — has **no named API at all**.

**The async pattern, since you will need it.** CDK distinguishes REST APIs from async APIs and uses a consistent three-tier long-operation shape: History Setup pulls records older than about 31 days, up to seven years back on the F&I example; Bulk pulls a date range; Delta pulls roughly the last two days of changes — all through operation-identifier polling [\[DOCUMENTED\]](#) ([CDK's modern API tools announcement](#), [BettrData's decision table for the CDK Drive APIs](#)). The precise polling endpoint paths were not read from a live spec [\[UNVERIFIED\]](#). Design implication: the twin needs an explicit staging layer that mirrors setup/bulk/delta and only writes into movement-document tables after reconciliation. Do not stream a delta straight into a valuation table.

**What it costs to be allowed to read your own records.** CDK's own published partner rate card is the clearest artefact: **extract-only access at a \$28 base fee plus \$23 per data type, per dealer, per month**; bundled extract packages \$81–\$150; writeback packages \$65–\$285 per dealer per month by module (Service Appointment \$285, Front Office \$285, F&I Menu \$230, Parts E-Commerce \$90 basic / \$175 premium, Payroll \$105, Customer Writeback \$65); plus a one-time development fee and a one-time per-dealer setup fee [\[DOCUMENTED\]](#) ([CDK Partner Program price guide](#)). Historically, post-2015 third-party access ran ~\$250–\$300 per month per connection and up to \$700 bi-directional, against ~\$70 before the programme was revised [\[DOCUMENTED\]](#) ([the Hoover Automotive antitrust complaint](#)). Against that, CDK eliminated the licence fees for its **own** Data Export and Import Tools in March 2023 — scheduled exports of predefined Service, Sales, Parts, Accounting and multi-store data sets to an SFTP folder, PGP-encrypted, requiring you to operate the receiving warehouse [\[DOCUMENTED\]](#) ([CDK's Data Export and Import Tools dealer FAQ](#), [CDK's 'Data – Your Way' page](#)).

**Conclusion, stated without hedging.** The twin's accounting spine cannot be built on APIs and should not be scoped as if it could. It has to be built on the free scheduled file export to SFTP, with the API surface used where it is genuinely deep — repair orders, parts, customers, vehicles. That is not a workaround; given the pricing structure it is also the cheaper architecture, since per-data-type extract fees scale with breadth and the export tool does not. The corollary is that the twin inherits file-cadence latency in accounting and near-real-time only in fixed operations, and the design has to be honest about that from day one.

**One live risk.** A 2025 Fortellis community post asks CDK to confirm whether Async Parts Inventory and Search Parts Pick Ticket are being replaced. No reply confirming continuity was found [\[UNVERIFIED\]](#) ([the Fortellis thread in question](#)). Two of the parts endpoints the twin would depend on may be mid-rename. Version-pin and abstract behind an adapter.

**Context you should have on why the surface looks like this.** CDK closed its previously open system in 2015 and, per litigation records, 3PA became “the only approved method for accessing” DMS data, with vendors contractually forbidden from obtaining data from anyone but CDK [DOCUMENTED]. What followed: a preliminary injunction against CDK and Reynolds in July 2017, vacated by the Seventh Circuit that November on remedy grounds without reaching the merits; consolidated multidistrict litigation; Reynolds settling the dealer class for \$29.5M; CDK paying \$100M in August 2024 [DOCUMENTED] ([coverage of the \\$100M dealer settlement](#)) and settling the 244-vendor class for \$600M — reported at \$630M including costs — in January 2025 [DOCUMENTED] ([Reuters on the \\$630M settlement](#)), admitting no wrongdoing in either. Arizona legislated a dealer data-access right and CDK's constitutional challenge failed at the Ninth Circuit [DOCUMENTED] ([the Ninth Circuit opinion](#)). A rival DMS sued CDK in December 2024 alleging it withholds and delays dealers' own data to obstruct migration [DOCUMENTED] ([Reuters on the Tekion suit](#)). **No FTC enforcement action against CDK was located [UNVERIFIED]** — the “FTC history” in circulation is private Sherman Act litigation plus state legislative friction, and should be described that way. Read the API surface as the residue of that history, not as an engineering roadmap.

## 08 PACCAR above the dealer

**The most useful single fact in this brief: PACCAR runs SAP.** Confirmed, piece by piece — S/4HANA as the ERP core, running on IBM Power (E870/E880C/E980) at 2TB scaling to 8–10TB per system [DOCUMENTED] ([the IBM/Mainline PACCAR case study](#)); SAP Transportation Management, Integration Suite, Analytics Cloud, Fiori and Intelligent RPA in an integrated transportation and global-trade platform run by PACCAR ITD's SAP centre of excellence, with the Fiori portal serving “Internal Users, Suppliers and Dealers” at half a million records a day [DOCUMENTED] ([PACCAR's SAP Innovation Awards submission](#)); BusinessObjects Financial Consolidation selected in 2016 for consolidation and close [DOCUMENTED] ([the BFC selection record](#)); Concur for travel and expense; SAP IBP for demand planning; and an active posting to upgrade SAP Global Trade Services [DOCUMENTED] ([PACCAR's SAP GTS analyst posting](#)). A PACCAR SAP applications manager posting names SD, MM, PP, PM, FI, CO, WM and COPA explicitly [DOCUMENTED] ([the PACCAR SAP S/4 manager posting](#)).

No single source states “PACCAR's ERP is 100% SAP”, so the blanket claim is [INFERRED]. But the assembled evidence is decisive on the point that matters: **the vocabulary you have spent thirty years in is the OEM's own vocabulary.** Modelling the dealer twin in SAP shape is not an abstraction chosen for elegance; it is alignment with the counterparty's actual system of record. Scale, for context: PACCAR's 2025 segment revenue is Truck \$19.37B (68%), Parts \$6.87B, Financial Services \$2.21B [DOCUMENTED] ([PACCAR 10-K coverage](#), [PACCAR annual report](#)).

### Dealer-facing PACCAR systems, and their integration posture

| SYSTEM                                       | FUNCTION                                                                                                                                                                                                                                   | PROGRAMMATIC ACCESS                                                                                       |
|----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>PACCAR ePortal</b>                        | SSO gateway to DealerNet: service manuals, wiring diagrams, the eCat parts catalogue, diagnostic software downloads, bulletins. Username, password and a digital certificate.                                                              | None documented. Browser and SSO only. [DOCUMENTED]                                                       |
| <b>PACCAR Solutions / service management</b> | Built on Decisiv. Fleet and customer service scheduling, case management, vehicle records across any PACCAR dealer in the US and Canada. Links a fleet customer account to the DMS <b>by customer number</b> .                             | Vendor platform; no public developer API found. [UNVERIFIED]                                              |
| <b>Online Parts Counter (OPC)</b>            | Parts e-commerce. CDK states the Drive Parts + OPC integration lets customers buy PACCAR and non-PACCAR parts at pricing levels drawn from the dealer's own CDK system, and that it is <b>required by PACCAR</b> . Available on Fortellis. | Fortellis-available through CDK; structured B2B order upload/download exists. [DOCUMENTED]                |
| <b>Managed Dealer Inventory (MDI)</b>        | PACCAR Parts owns the stocking algorithm: analyses retail sell-through, transmits daily order recommendations per dealer location.                                                                                                         | Batch exchange. Order types Stock, MKT, COF documented via a DMS integration; no public API. [DOCUMENTED] |
| <b>PRWS (registration and warranty)</b>      | Claim submission and adjudication. CDK creates drafts in PRWS from RO data and tracks them on a dynamic status screen.                                                                                                                     | On Fortellis. The only documented OEM warranty submission path. [DOCUMENTED]                              |
| <b>DAVIE4</b>                                | Diagnostics and programming: engine calibration, road-speed changes, fault diagnosis.                                                                                                                                                      | Desktop software tied to ePortal credentials. No API. [DOCUMENTED]                                        |
| <b>TruckTech+ / SmartLINQ</b>                | Remote diagnostics and telematics case management on Decisiv. Auto-creates service cases from fault codes and transfers estimates into the DMS; the case auto-closes when the RO is invoiced.                                              | Bidirectional with the DMS at repair-order level. No third-party API. [DOCUMENTED]                        |

| SYSTEM                               | FUNCTION                                                                                                                                                        | PROGRAMMATIC ACCESS                                                                                               |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <b>Service Gate</b> (Fleet Services) | Point-of-sale authorisation, price verification and electronic remittance for national fleet accounts — 250-plus trucks, consolidated billing across locations. | Structured invoice and remittance transmission via DMS integration. <b>[DOCUMENTED]</b>                           |
| <b>FOCUS CRM</b>                     | PACCAR Parts' CRM, fed customer and parts sales data from the dealer DMS for purchasing-pattern insight.                                                        | One-way feed out of the dealer's system. <b>[DOCUMENTED]</b>                                                      |
| <b>"PACCAR's B2B infrastructure"</b> | Source of truck build data and specifications pulled into the dealer DMS. Named only generically.                                                               | Whether this is one platform, an EDI gateway, or a family of point-to-point feeds is unknown. <b>[UNVERIFIED]</b> |

System inventory from [CDK's Heavy Truck OEM page](#), [Karmak's PACCAR integration page](#) (the single richest public enumeration of PACCAR dealer integration points), [PACCAR Parts services](#), [PACCAR Parts technology](#), [a dealer's description of PACCAR Solutions service management](#), [the ePortal/eCat user guide](#), [PACCAR Parts Fleet Services](#) and [PACCAR's Decisiv customer-linking documentation](#).

### Warranty, in the detail a claim actually needs

Repair, then diagnosis recorded with cause and correction. Claim entry offers a Quick Claim against a pre-coded campaign or failure code — the published example is E286A — or a long claim with manual entry of campaign number, failure type and standard repair time. Cross-division repairs, such as a Kenworth dealer working on a Peterbilt chassis, use a distinct claim path **[DOCUMENTED]** ([an NHTSA technical bulletin walking the PRWS claim path](#)). Required data: VIN, causal or removed part number, claim category (the published example is PBSA for steel-axle claims), concern/cause/correction narrative, standard repair time code, claim story text, and for parts warranty a purchase receipt and photos **[DOCUMENTED]** ([PACCAR-side warranty portal instructions](#)). **Filing deadlines are enforced per policy bulletin** — a documented instance is fourteen days under a named policy **[DOCUMENTED]**. Version 1.2 of the integration added pulling service information record sheets from PACCAR, and claims can be saved, resent or renumbered without re-entry **[DOCUMENTED]** ([a competing DMS's PRWS integration release notes](#)).

**The chargeback hole.** How PACCAR debits a dealer's warranty receivable when a paid claim is later denied or adjusted, and which GL account or screen absorbs it, is **not in any public PACCAR document** **[UNVERIFIED]**. The norm — charged back against warranty receivable and expensed to the service department — is **[INFERRED]**. Given a deadline-enforced, narrative-scored claim process and a vendor selling recovery consulting, quantifying this exposure should be an early analytical target for the twin: it is measurable from RO and claim data the dealer already holds.

### Parts logistics and vehicle ordering, briefly

PACCAR Parts runs 18–20 distribution centres across North America, Europe, Australia, Mexico and Central/South America with over 3.1 million square feet **[DOCUMENTED]**. Cadence is real: a UK centre processes over 5,000 orders a day with emergency orders received by 6pm delivered by 8am next morning, and the Las Vegas centre processes over 300 emergency lines a day to all North American dealers **[DOCUMENTED]** ([PACCAR Parts UK distribution centre](#), [the Las Vegas centre opening](#)). Dealer-to-OEM returns were automated in 2022 on a service-lifecycle platform with a returns module **[DOCUMENTED]** ([the Synchron PACCAR returns case study](#)). Electronic invoices flow into DMS AP and electronic packing slips are used to receive parts **[DOCUMENTED]**.

On the vehicle side: public configurators are lead tools, not order entry. Actual factory ordering runs through the dealer sales process, where a signed sales order, a deposit and credit approval or proof of funds reserve a **build slot** — a scarce resource allocated against plant capacity and model-year cutoffs **[DOCUMENTED]** ([a Rush Truck Centers walkthrough of Peterbilt build slots](#)). **The name of PACCAR's factory order-entry system is not public** **[UNVERIFIED]**; it is referenced only as part of the B2B infrastructure. Body-builder tooling keys on the eight-character chassis number — the last eight of the VIN — to retrieve build data **[DOCUMENTED]** ([Peterbilt's body builder PTO programming guide](#)), and pre-build frame-layout files are available on request before the truck is built **[DOCUMENTED]**.

### Telematics ownership — read this before scoping anything above the RO

PACCAR's own connectivity terms, governing TruckTech+, SmartLINQ, PACCAR Solutions, PACCAR Connect and Remote Diagnostics, collect vehicle description, GPS location, speed, direction and time of travel, odometer, start/stop events, fault codes, engine data, VIN, mechanical condition, and — verbatim — "any information, nonpublic or otherwise, relating to your Vehicle or its use." Location and diagnostic data are transmitted "regardless of your Subscription status" **[DOCUMENTED]** ([PACCAR Truck Connectivity Services Terms](#)).

**The terms never say who owns it.** PACCAR asserts a right to collect, use and retain, and states the customer “does not own the Services software”. That is a services and licence framing, not a property framing. Dealer access is PACCAR-mediated and purpose-limited to “service or other performance” reporting. A vehicle owner can request review or correction of the data only by contacting the selling dealership — the dealer is an intermediary, not a controller. Data may be disclosed to wireless carriers, suppliers, licensors, manufacturers, distributors and authorised dealers, and used to develop further PACCAR products and services [DOCUMENTED].

**Consequence for scope.** No dealer-initiated bulk export or open API for raw telematics was found in any public source [UNVERIFIED]. Above the parts and service transaction layer, sovereignty is contractually foreclosed, not merely technically awkward. The defensible line for the twin is the repair-order boundary: ingest the slice that syncs into the RO — estimate, parts, labour — and treat the telematics case record as somebody else’s system of record. Claiming otherwise in front of PACCAR would be a mistake.

## Where PACCAR reaches into the dealer's ledger

One line from a competing DMS's PACCAR integration page settles the question of whether the OEM sees the books: “Financial statements are automatically downloaded to PACCAR” [DOCUMENTED] ([the Karmak PACCAR integration page](#)). The dealer's monthly statement is an automated OEM feed, not a document the dealer chooses to send. What is **not** public: PACCAR's required chart-of-accounts numbering, the statement format, the submission deadline, and the penalty for late or incomplete filing [UNVERIFIED]. Those almost certainly live in the dealer agreement and dealer operating manual, which are not public documents. The industry norm is the NADA departmental format [INFERRED] ([NADA on the dealership financial statement](#)), and heavy-truck benchmarking runs through NADA's American Truck Dealers division composites [DOCUMENTED] ([ATD Data](#)) — but whether Peterbilt Atlantic reports into an ATD composite or a PACCAR-proprietary equivalent is [UNVERIFIED].

## Standards, and one correction to carry forward

STAR defines XML Business Object Documents for dealer-to-OEM traffic — Parts Order, Parts Pick List, Parts Return, Repair Order, Sales Lead, Vehicle Service History, Warranty Reconciliation — and names medium and heavy-duty trucks as a supported segment [DOCUMENTED] ([STAR XML BODs](#)). The 2024 STAR6 v6.2.4 release added Retail Delivery Report, Vehicle Invoice, Vehicle Order, Vehicle Price List, Vehicle Shipment, Vehicle Specifications and Dealer Support Case [DOCUMENTED] ([the v6.2.4 release note](#)); the January 2026 Automotive Retail Domain Model finalised Parts, Accounting, Payroll and HR domains, with the service standard moving from XML to JSON [DOCUMENTED] ([the STAR Domain Model announcement](#)). That Accounting domain is the closest public artefact to a standardised dealer ledger interchange model and is worth reading before the twin freezes its own extract schema. On the truck side, VMRS from the ATA Technology & Maintenance Council is the live parts/component/failure vocabulary — Karmak licensed it in 2025 specifically to standardise service data shared with dealers, fleets and OEMs [DOCUMENTED] ([the Karmak VMRS licensing report](#)).

**Correction.** The ODDX in the original brief does not exist as a standard. The real artefact is **ODX**, ISO 22901-1, an ASAM/ISO XML format for ECU diagnostic data exchange between OEMs, tier-one suppliers and diagnostic-tool vendors [DOCUMENTED] ([the ODX ISO 22901-1 overview](#)). It governs how diagnostic capability descriptions reach a shop-floor tester of the DAVIE4 class. **It has nothing to do with commercial or ledger data** and should not appear in the twin's data-model discussion. Whether PACCAR is a formal STAR member, and which BODs it implements versus proprietary point-to-point feeds, is [UNVERIFIED].

## 09 Exit economics, and the capital-versus-subscription argument

Contract mechanics first, because they set the clock. DMS providers license to dealers under written contracts of **five to seven years** per the antitrust pleadings [DOCUMENTED] ([the Hoover Automotive complaint](#)). CDK's published API Licensing Terms auto-renew for consecutive one-year periods until terminated, with a thirty-day notice right — but that is the developer agreement [DOCUMENTED] ([CDK API Licensing Terms](#)); **the notice period in the core dealer DMS master agreement is not public** [UNVERIFIED]. The same complaint alleges CDK's standard contract gives first-year price protection then imposes a **6% automatic annual increase** thereafter, with Reynolds tied to CPI + 2% [DOCUMENTED] as an allegation. And early exit is not costless: in CDK Global v. Tulley Automotive Group CDK sued a departing dealer seeking acceleration of payments owed and return of leased equipment [DOCUMENTED] ([the Tulley case summary](#)).

| ELEMENT                            | FIGURE                                                                                                                                                                                                                      | EVIDENCE QUALITY                                                                                                                                                                      |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DMS cost per rooftop per month     | \$3,500 – \$7,000, varying by size and complexity                                                                                                                                                                           | Cited by a procurement guide to “a 2023 NADA study”; the underlying NADA publication was never retrieved. Treat the band as indicative, not as a quotable figure. <b>[UNVERIFIED]</b> |
| Implementation / setup, one-time   | \$10,000 – \$50,000+ per rooftop                                                                                                                                                                                            | Same secondhand source. <b>[UNVERIFIED]</b>                                                                                                                                           |
| Extract-only data access           | \$28 base + \$23 per data type, per dealer per month                                                                                                                                                                        | CDK's own published Partner Program rate card. First-party. <b>[DOCUMENTED]</b>                                                                                                       |
| Writeback packages                 | \$65 – \$285 per dealer per month by module (Service Appointment \$285, Front Office \$285, F&I Menu \$230, Parts E-Commerce \$90/\$175, Payroll \$105) plus a one-time development fee and a one-time per-dealer setup fee | Same first-party rate card. <b>[DOCUMENTED]</b>                                                                                                                                       |
| Historical 3PA connection fees     | ~\$250–\$300 per connection per month; up to \$700 bi-directional; ~\$70/month/rooftop before February 2015                                                                                                                 | From court filings, so accurate as of the pleading, not as of today. <b>[DOCUMENTED]</b>                                                                                              |
| Data Export / Import Tools licence | Fees eliminated; free licence since March 2023                                                                                                                                                                              | CDK's own dealer FAQ. This is the cheap path and it is real. <b>[DOCUMENTED]</b>                                                                                                      |
| Conversion cost per employee       | “as much as \$5,000 per employee” in delay and training                                                                                                                                                                     | Vendor claim, unaudited. <b>[UNVERIFIED]</b>                                                                                                                                          |

### The arithmetic you will do anyway, with the caveat attached

Nine rooftops against that unverified \$3,500–\$7,000 band is **\$31,500–\$63,000 per month, \$378,000–\$756,000 per year**, before extract and writeback fees, before implementation amortisation, and before whatever the 6% escalator has already compounded. **That range is derived from a figure this research could not verify to primary source **[UNVERIFIED]** —** do not put it in front of the owner without either obtaining the actual invoices or retrieving the NADA study. The invoices are the cheaper path and they are in the building. What is first-party and quotable is the rate card: CDK meters access to the dealer's own transactional data as a separate product line from the DMS subscription **[DOCUMENTED]** ([the CDK Partner Program price guide](#)). That single document does more argumentative work than any cost estimate.

### What leaving actually costs, mechanically

**No public CDK document specifies a guaranteed export format or a completeness standard on termination **[UNVERIFIED]**.**

Practitioner guidance for dealers changing DMS reduces to two questions the dealer is advised to ask in writing: do you have access to your data, and what format is it in — flagging that some providers do not give direct access and that reformatting can be costly **[DOCUMENTED]** ([AutoRemarketing on converting data](#)). Add the retention mismatch: a five-year contract term against a commonly cited seven-year document-retention expectation leaves a gap at turnover that somebody has to fund **[INFERRED]** — the specific statute was not verified **[UNVERIFIED]** ([the DMS “gotcha” note](#)). Practical timeline: begin evaluation ten to twelve months before expiry, send non-renewal by certified mail, and expect a buyout if you cancel mid-term **[DOCUMENTED]** ([DealerTechNerd on changing DMS](#)).

**The strategic reading:** the exit cost is not the buyout. It is that the dealer has no independently held, format-stable copy of its own operating history to hand to a successor system. A twin fed by the free scheduled export resolves that whether or not anybody ever leaves — which is why it is worth building even on the assumption CDK is retained indefinitely.

### Capital versus subscription, stated in the standards

| QUESTION                                                           | ANSWER                                                                                                                                                                                                                                                                                                                                                   | AUTHORITY                                              |
|--------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| Can the CDK subscription be capitalised?                           | No. A right to access a supplier's hosted software over a term, rather than control of an identifiable resource, fails the control recognition criterion. PwC is explicit that the subscription fee cannot be capitalised as an intangible under IAS 38. US GAAP reaches the same place: SaaS is generally a service contract, not capitalised software. | IAS 38; ASC 350-40 for comparison. <b>[DOCUMENTED]</b> |
| When must internally developed software be capitalised under IFRS? | Once all six IAS 38 ¶57 criteria are simultaneously met — technical feasibility, intention to complete, ability to use or sell, probable future economic benefit, adequate resources to finish, and reliable measurement of attributable expenditure. Capitalisation is then mandatory, not optional. Research-phase cost is always expensed.            | IAS 38 ¶57. <b>[DOCUMENTED]</b>                        |

| QUESTION                                                                                             | ANSWER                                                                                                                                                                                                                                                                                                                                 | AUTHORITY                                                           |
|------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------|
| What changes under ASPE 3064 — the framework that actually applies to a Canadian private enterprise? | Recognition needs identifiability, control, and reliably measurable cost. But ASPE gives private Canadian enterprises an <b>accounting policy choice</b> IFRS does not: development costs meeting the criteria may be either expensed or capitalised. That is a live decision for the group's accountant, not a given.                 | ASPE Section 3064; BDO's ASPE/IFRS comparison. <b>[DOCUMENTED]</b>  |
| Why the sovereignty argument is an accounting argument                                               | Both frameworks hinge on <b>control</b> — the contractual right to obtain the software without significant penalty, and the ability to run or migrate it without significant decrease in utility or value. A dealer paying a subscription plus per-data-type extract fees fails that test by construction. The rate card is the proof. | AcG-20 control guidance; CDK's own price guide. <b>[DOCUMENTED]</b> |

Sources for the block above: [PwC on cloud-computing accounting](#), [IAS 38 development-cost criteria](#), [BDO ASPE-IFRS intangibles comparison](#), [BDO on AcG-20 and the control test](#).

**Net position, in balance-sheet terms.** The subscription is a rental. After ten years of payments it leaves nothing on the balance sheet and nothing in the dealer's hands at exit. A dealer-controlled twin, if the recognition tests are met, is an intangible asset carried and amortised over useful life — in your vocabulary, an asset master under ANLA/ANLZ rather than a recurring expense line. That is the whole argument, and it is made out of accounting standards rather than adjectives. The honest caveat: under ASPE the capitalisation is a policy election, and the six IAS 38 tests still have to be documented contemporaneously to survive review.

### Two Canadian constraints that bear on where the twin sits

PIPEDA does not prohibit transferring personal information to a processor outside Canada, but accountability under Principle 1 remains with the transferring organisation regardless of where processing happens **[DOCUMENTED]** ([the Privacy Commissioner's cross-border guidelines](#)). A Canadian dealer on a US-hosted DMS cannot contract that away by pointing at the vendor. Quebec's Law 25 attaches a mandatory privacy impact assessment before any cross-border transfer, plus a written agreement incorporating its findings, with administrative penalties to CAD \$10M or 2% of global turnover and penal exposure to CAD \$25M or 4% **[DOCUMENTED]** ([BLG on cross-border transfers outside Quebec](#)). Atlantic Canada sits under federal PIPEDA; the practical Law 25 trigger is counterparty residency, not dealer location **[INFERRED]** — so any Quebec-resident customer record in the group pulls that subset into scope.

## 10 What is not verified — the full carry-forward

Every open question from all eight lanes, numbered so they can be assigned. Nothing here has been quietly resolved by inference. Items marked **[cheap]** are answerable from inside Peterbilt Atlantic in an afternoon — a screen, an invoice, a contract, one call to the CDK account team — and should be closed before any further public research is commissioned.

### Platform and partitioning

- Whether "Company Number" is exposed anywhere in the modern Fortellis REST layer as its own field or header, or is purely a legacy back-office and EDI-era concept superseded by Subscription-Id plus Department-Id. No Fortellis spec naming a company-number header was found. **[cheap]**
- Whether the nine Peterbilt Atlantic rooftops are in fact nine Company Numbers under one Dealer/CMF, or a different arrangement. Inferred from partner setup documentation only. **[cheap]**
- The complete current list of Fortellis-listed CDK Drive APIs with version numbers. The API Directory is a live authenticated UI; this note compiles what surfaced through partner guides, press releases and public specs, which is a subset.
- Exact OpenAPI operation names and paths for the asynchronous start-poll-pull endpoints — the precise operationId polling path was never fetched from a live spec.
- Current 2026 3PA and CDK Data Services per-API pricing. Court-filing figures are 2015–2018; the only current number is a third-party agency estimate. **[cheap]**
- Whether PACCAR heavy-truck configurations in CDK Drive use the identical Department-Id / DMS-type partition scheme documented for light-vehicle dealers, or a heavy-truck variant. No heavy-truck-specific CDK API documentation exists publicly. **[cheap]**
- "CDK Data Cloud" as a distinct currently marketed product — not found under that name. Do not assume it maps to the Data Export/Import Tool suite.

### Ledger and close

- A PACCAR or Peterbilt dealer accounting manual or chart of accounts, equivalent to the GM or Ford manuals. Not publicly locatable. PACCAR's factory statement format and account numbers are unknown. **[cheap — it is in the dealer agreement]**
- CDK Drive's actual internal schedule numbers or names — no equivalent to Ford's 1140 or an Autosoft GLSKEDS export was found in any CDK document. **[cheap — visible on screen]**

10. The CDK Drive screen or table name for posting-period lock and closed-period enforcement. The architecture is inferred from cross-DMS norms only. **[cheap]**
11. Whether CDK Drive outputs a labelled GAAP or ASPE statement distinct from the OEM statement, and what that report is called. **[cheap]**
12. Full request and response schema of the glpost and glwipost APIs — journal line fields, period fields. Only endpoint paths and existence were confirmed, via a support thread; the spec page returned not-found.
13. Any CDK-specific curtailment or floor-plan GL account numbers. Only generic OCC-level curtailment mechanics and the existence of PACCAR Financial Services as a wholesale lender were confirmed. **[cheap]**

### Cost objects

14. The CDK host-side field or table name for the department dimension on a raw GL posting line. Only the externally exposed Department-Id header is documented.
15. The literal field name for flat-rate hours or book time inside the OpCodes API schema. Only the API's existence is confirmed.
16. Whether CDK Drive posts an explicit elimination entry for internal work between departments, or nets the transfer purely through the vehicle inventory schedule. No public source reaches this granularity. **[cheap]**
17. The GL account and field breakdown — acquisition, pack, recon labour, recon parts, floor-plan interest — inside the Display Vehicle Cost roll-up. **[cheap]**
18. Whether CDK exposes native technician efficiency and proficiency as calculated fields, or whether these are purely downstream 20-group and report constructs. **[cheap]**
19. Whether Peterbilt/PACCAR dealers report into NADA's ATD composite specifically, or a PACCAR-proprietary equivalent. **[cheap]**
20. Whether the 40-plus pay-type and service-type codes cited in this note reflect a CDK-wide standard or one dealer's configuration. The source is a single dealer's reference sheet. **[cheap]**

### Parts and materials

21. The internal CDK table or column name for the supersession chain pointer. Only the function name and observed behaviour are documented.
22. Whether CDK Drive Async Parts Inventory and CDK Drive Search Parts Pick Ticket are being renamed or deprecated — a 2025 community post asks CDK to confirm current equivalents and no reply was found. **[cheap — ask the account team]**
23. Whether CDK Drive exposes a raw average or replacement cost field distinct from the escalated point-of-sale cost. The Fortellis schema documents only the escalated value. **[cheap]**
24. A formally named CDK Drive cycle-count or physical-inventory function or screen code. Only informal rotational-bin practice and the Parts Events reporting path are documented. **[cheap]**
25. A formally named VOR order type in PACCAR's North American dealer ordering system. VOR terminology is confirmed for PACCAR Parts Australia and for other OEMs, but the confirmed North American order types are only Stock, Emergency, MKT and COF.
26. Any PACCAR-specific parts obsolescence or return-allowance percentage or programme name. The CNH 100%-at-one-year figure is a non-PACCAR analogue only. **[cheap]**
27. The full published field list for Get Parts Sales, History Setup Parts Sales, and the Async Open/Closed Parts Sales pair. Marketing pages name them; the specs sit behind Marketplace subscription access.
28. "PartsPRO" as a PACCAR system name — searched extensively, not found in any public PACCAR source. Treat as non-existent. The correct name is Online Parts Counter.

### Master records

29. Full field schema for the Get Employee API. The name is confirmed via an announcement post only; no developer guide exists publicly.
30. Any field-level vendor or AP master schema — vendor number format, tax fields, remit-to address structure. **[cheap]**
31. Any field-level GL account master schema — account number length and segmentation, account type codes, cost-centre or store-segment structure. **[cheap]**
32. Whether customerId is unique per company number or can be shared across rooftops within a single tenant. Not stated in any source. **This is the single most consequential open question in the master-data lane. [cheap]**
33. CDK Heavy Truck field names for chassis number, unit number, or body-builder and spec configuration records. The product line's existence is documented; its schema is not. **[cheap]**
34. Whether CDK Drive has any automated or fuzzy-match customer deduplication tool as opposed to manual merge screens. No public source confirms or denies. **[cheap]**
35. Whether Canadian CDK dealers use optOutFlag and isDeleteDataFlag operationally for CASL, or rely entirely on external consent management. Only CCPA, a US statute, is named in the schema. **[cheap]**
36. A distinct wholesale vehicle-inventory status field name. Wholesale is documented at customer level and via acquired type, not as a vehicle status.

### Document flow

37. Field or table names for the deal desk and washout screen, We-Owe line-item structure, or any general-purpose Deals write API. Only a read-only FI Sales extract and a referenced but unconfirmed Deals spec ID were found.

- 38. Any public API for multi-point inspection, sublet lines, or RO quality-control sign-off as distinct objects.
- 39. Special-order and counter-ticket header and line field names in Parts. **[cheap]**
- 40. A generic, non-PACCAR warranty-claim CRUD API in CDK Drive. None found.
- 41. Named AR screens or tables for statements, deposits and daily deposit reconciliation. **[cheap]**
- 42. Confirmation of three-way match logic natively inside CDK Drive AP. Inferred from ERP norms and a competitor's PACCAR integration only. **[cheap]**
- 43. Any CDK Drive-native payroll or commission-calculation API. All evidence points to file export and GL push via third-party payroll vendors.
- 44. Whether CDK Drive itself, as opposed to the PACCAR Fleet Services and Decisiv layer, has a native multi-unit fleet billing or mobile-service RO object. **[cheap]**

### Landscape and exit

- 45. The primary NADA or ADA study behind the \$3,500–\$7,000 per-rooftop figure. Cited secondhand only; never retrieved. **[cheap — use the group's own invoices instead]**
- 46. Whether any FTC enforcement docket exists against CDK, as opposed to private Sherman Act litigation and state legislative conflict. None found; the brief's "FTC history" framing may need correcting.
- 47. Karmak Fusion, Procede Excede and CDK Drive Heavy Truck per-rooftop pricing. None of the three vendors publishes it.
- 48. Any CDK document specifying a guaranteed export format or completeness standard on termination of the core DMS. **[cheap — read the contract]**
- 49. The claim that CDK enterprise contracts discount approaching 25% for ten-plus-rooftop groups. Secondhand consulting-blog sourcing only. **[cheap]**
- 50. Tekion's and Autosoft's applicability to heavy-duty dealers specifically. Both appear light-vehicle-focused on available material.
- 51. The notice-period length in the core dealer CDK agreement. Only the API Licensing Terms' thirty-day clause is public. **[cheap — read the contract]**
- 52. The jurisdictional statute behind the seven-year retention expectation cited against the five-year contract term. **[cheap — ask the group's accountant]**
- 53. **Which DMS Peterbilt Atlantic actually runs.** The brief specifies CDK Drive, but PACCAR-network dealers commonly run Karmak Fusion or Procede Excede, both with documented PACCAR integrations. This should be confirmed before any of this note's CDK-specific detail is relied on. **[cheap — and it is the first question to close]**

### PACCAR and the OEM surface

- 54. The exact chargeback mechanism and GL treatment when PACCAR denies or adjusts a paid warranty claim. **[cheap — the warranty administrator knows]**
- 55. Whether PACCAR is a formal STAR member, and which STAR BODs it implements versus proprietary feeds.
- 56. The literal name and any API surface of PACCAR's factory vehicle order-entry system, distinct from the public configurators and from OPC. **[cheap]**
- 57. PACCAR's chart-of-accounts numbering and financial-statement submission deadline requirements for dealers. Only the NADA-format norm and the fact of an automated month-end download are documented. **[cheap]**
- 58. Whether "PACCAR's B2B infrastructure" is a single named platform, an EDI gateway, or a family of point-to-point feeds.
- 59. Any dealer-facing published percentage or formula for parts obsolescence buy-back. Only the supplier-facing 120-day purchase-order clause was found.
- 60. Whether TruckTech+, SmartLINQ or PACCAR Connect ever expose a bulk or programmatic export path to the dealer or fleet owner, versus portal viewing only. **Assume no until proven otherwise.**
- 61. Whether PACCAR's own SAP estate is in fact end-to-end. The confirmed components are S/4HANA, TM, GTS, IBP, BFC and Concur; the blanket claim is not sourced.

**61 open items, 37 of them marked cheap** — answerable from the group's own screens, invoices and contracts without a single further external search. **Item 53 is the one that gates everything else:** confirm which DMS is actually in production before any of this note's CDK-specific field detail is designed against. Item 32 is next — the scope of customer-number uniqueness decides whether the twin needs a group-level golden-record layer. The remainder are genuine public-record gaps, and several — the GL post API schema, the vendor and GL account masters, a general warranty API — are unlikely to be closed from outside at all, because the artefacts are not published anywhere.

## 11 Sources

Every source cited across the eight research lanes, in the order first cited, grouped by lane. 320 distinct sources. All are clickable. Nothing in this note rests on an uncited assertion; where a claim had no source, it was marked **[UNVERIFIED]** and left in section 10 instead.

Working record: the eight lane files ([cdk\\_01\\_platform.md](#) through [cdk\\_08\\_paccar\\_oem.md](#)) hold the full tabular detail behind this synthesis, including the proposed SAP-shape mapping table each lane ends with. The existing parts-lane schema this note extends is at [the eve-dealer-parts-twin repository](#). Prepared for Dany Thériault, EVEglyphDesign, 29 July 2026. Format per Executive Boot Contract EgD-BOOT-001 §4.
